Nepal has many traditional restaurants that go undiscovered just because they do not have a trace online. Most of these restaurants end up getting closed due to a lack of exposure to the public. This leads them to be surpassed by urban restaurants in a competitive economy. This web application will try to bridge the gap between these traditional restaurants and the people of Nepal. It will be a platform for these traditional restaurants to advertise themselves without any cost. Not only is this app meant to serve as a platform for the restaurants, but it will also provide the users with relevant information about the restaurants listed. The users will be able to rate and review the restaurants they visit in the web application. Along with this, FindMyRestro will also recommend restaurants to its users in accordance with their past likes. It has been difficult to obtain data from Nepal right now due to its geographical distance. Therefore, for the testing phase, FindMyRestro will use the restaurants around Trinity College. The app uses firebase for the database, storage and deployment because of its cost-free service for lighter web applications.
