

You learned about tropical climates and the causes of tropical climates in class. now it's time to use your class and book knowledge and apply it to a specific example.

1. Chose a city that is situated within the tropics and determine it's position (longitude and latitude)
2. Obtain a climate record of your city of choice (monthly precipitation and temperature averages)
3. Draw a graph of the data and determine the important aspects of the climate record. These could include the amount and distribution of precipitation, temperature variations etc.
4. Explain the climate record of your city of choice using the information you have learned so far in class.
