IEEE Standard for Information technology—
Telecommunications and information exchange between systems
Local and metropolitan area networks—
Specific requirements

Part 11: Wireless LAN Medium Access Control
(MAC) and Physical Layer (PHY) Specifications

Sponsor
LAN/MAN Standards Committee
of the
IEEE Computer Society

Approved 6 February 2012
IEEE-SA Standards Board
Abstract: This revision specifies technical corrections and clarifications to IEEE Std 802.11 for wireless local area networks (WLANS) as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. It also incorporates Amendments 1 to 10 published in 2008 to 2011.

Keywords: 2.4 GHz, 3650 MHz, 4.9 GHz, 5 GHz, 5.9 GHz, advanced encryption standard, AES, carrier sense multiple access/collision avoidance, CCMP, channel switching, Counter mode with Cipher-block chaining Message authentication code Protocol, confidentiality, CSMA/CA, DFS, direct link, dynamic frequency selection, E911, emergency alert system, emergency services, forwarding, generic advertisement service, high throughput, IEEE 802.11, interface, international roaming, interworking, interworking with external networks, LAN, local area network, MAC, measurement, medium access control, media-independent handover, medium access controller, mesh, MIH, MIMO, MIMO-OFDM, multi-hop, multiple input multiple output, network advertisement, network discovery, network management, network selection, off-channel direct link, path-selection, PHY, physical layer, power saving, QoS, quality of service, PHY, physical layer, QoS mapping, radio, radio frequency, RF, radio resource, radio management, SSP, SSPN, subscriber service provider, temporal key integrity protocol, TKIP, TPC, transmit power control, tunneled direct link setup, wireless access in vehicular environments, wireless LAN, wireless local area network, WLAN, wireless network management, zero-knowledge proof
Notice and Disclaimer of Liability Concerning the Use of IEEE Documents: IEEE Standards documents are
developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association
(IEEE-SA) Standards Board. IEEE develops its standards through a consensus development process, approved by the
American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to
achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation.
While IEEE administers the process and establishes rules to promote fairness in the consensus development process,
IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any
judgments contained in its standards.

Use of an IEEE Standard is wholly voluntary. IEEE disclaims liability for any personal injury, property or other damage,
of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from
the publication, use of, or reliance upon any IEEE Standard document.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly
disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific
purpose, or that the use of the material contained in its standards is free from patent infringement. IEEE Standards
documents are supplied "AS IS."

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase,
market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint
expressed at the time a standard is approved and issued is subject to change brought about through developments in the
state of the art and comments received from users of the standard. Every IEEE standard is subjected to review at least
every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable
to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are
cautioned to check to determine that they have the latest edition of any IEEE standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for,
or on behalf of, any person or entity. Nor is IEEE undertaking to perform any duty owed by any other person or entity to
another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in
the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional
determining the appropriateness of a given IEEE standard.

Translations: The IEEE consensus development process involves the review of documents in English only. In the event
that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE
standard.

Official Statements: A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards
Board Operations Manual shall not be considered the official position of IEEE or any of its committees and shall not be
considered to be, nor be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational
courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be
considered the personal views of that individual rather than the formal position of IEEE.

Comments on Standards: Comments for revision of IEEE Standards documents are welcome from any interested party,
regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice
pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed
change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of
concerned interests, it is important to ensure that any responses to comments and questions also receive the concurrence
of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees
are not able to provide an instant response to comments or questions except in those cases where the matter has
previously been addressed. Any person who would like to participate in evaluating comments or revisions to an IEEE
standard is welcome to join the relevant IEEE working group at http://standards.ieee.org/develop/wg/.

Comments on standards should be submitted to the following address:
Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854
USA

Photocopies: Authorization to photocopy portions of any individual standard for internal or personal use is granted by
The Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright
Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer
Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any
individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.
Notice to users

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

This document is copyrighted by the IEEE. It is made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making this document available for use and adoption by public authorities and private users, the IEEE does not waive any rights in copyright to this document.

Updating of IEEE documents

Users of IEEE standards should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA website or contact the IEEE at the address listed previously. For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA website.

Errata

Errata, if any, for this and all other standards can be accessed at the following URL: http://standards.ieee.org/findstds/errata/index.html. Users are encouraged to check this URL for errata periodically.

Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. A patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA website http://standards.ieee.org/about/sasb/patcom/patents.html. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or nondiscriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.
Participants

At the time this revision was sent to sponsor ballot, the IEEE 802.11 Working Group had the following officers:

Bruce Kraemer, Chair
Jon Walter Rosdahl, Vice-Chair and Treasurer
Adrian P. Stephens, Vice-Chair, Technical Editor and Assigned Number Authority
Stephen McCann, Secretary
Peter Ecclesine, Technical Editor
Clint Chaplin, Chair, Wireless Next Generation Standing Committee
David Bagby, Chair, Architecture Standing Committee
Andrew Myles, Chair, JTC1 Ad hoc
Richard H. Kennedy, Chair, Regulatory Ad hoc and Task Group af
Hiroshi Mano, Chair, FIA Study Group
Dorothy Stanley, Chair, Task Group mb and Task Group v
Dee Denteneer, Chair, Task Group s
Menzo M. Wentink, Chair, Task Group z
Ganesh Venkatesan, Chair, Task Group aa
Osama S. Aboul-Magd, Chair, Task Group ac
Eldad Perahia, Chair, Task Group ad
Michael Montemurro, Chair, Task Group ae
Dave Halasz, Chair, Task Group ah

The officers and members of the Task Group mb Working Group ballot pool are as follows:

Matthew S. Gast, Chair (to March 2010)
Dorothy Stanley, Chair (from May 2010)
Michael Montemurro, Vice Chair
Jon Walter Rosdahl, Secretary
Adrian P. Stephens, Editor

Santosh P. Abraham, Philippe Chambelin, Darwin Engwer
Tomoko Adachi, Douglas S. Chan, Vinko Erceg

IEEE Standards Program Managers, Technical Program Development
This introduction is not part of IEEE Std 802.11-2012, IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area network—Specific requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) specifications.

This revision gives users, in one document, the IEEE 802.11 standard for wireless local area networks (WLANS) with all the amendments that have been published to date.

Incorporating published amendments

The current revision, IEEE Std 802.11-2012, incorporates the following amendments into the 2007 revision:

- IEEE Std 802.11k™-2008: Radio Resource Measurement of Wireless LANs (Amendment 1)
- IEEE Std 802.11r™-2008: Fast Basic Service Set (BSS) Transition (Amendment 2)
- IEEE Std 802.11y™-2008: 3650–3700 MHz Operation in USA (Amendment 3)
- IEEE Std 802.11w™-2009: Protected Management Frames (Amendment 4)
- IEEE Std 802.11n™-2009: Enhancements for Higher Throughput (Amendment 5)
- IEEE Std 802.11p™-2010: Wireless Access in Vehicular Environments (Amendment 6)
- IEEE Std 802.11z™-2010: Extensions to Direct-Link Setup (DLS) (Amendment 7)
- IEEE Std 802.11v™-2011: IEEE 802.11 Wireless Network Management (Amendment 8)
- IEEE Std 802.11u™-2011: Interworking with External Networks (Amendment 9)
- IEEE Std 802.11s™-2011: Mesh Networking (Amendment 10)

As a result of publishing this revision, all of the previously published amendments and revisions are now retired.

Technical corrections, clarifications, and enhancements

In addition, this revision specifies technical corrections and clarifications to IEEE Std 802.11 as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. Such enhancements include incorporated interpretation requests.

Revised clause and annex numbering

In IEEE Std 802.11-2012, the order of clauses and annexes has also been revised. The result of this revised order on the numbering of clauses and annexes is summarized in Figure A.
Figure A—Changes in clause numbers and annex letters from 2007 revision to 2012 revision

11.6.8.3  PeerKey setup and handshake error conditions

11.6.8.4  STKSA rekeying

11.6.8.5  Error Reporting

11.6.9  TDLS Peer Key security protocol

11.6.9.1  General

11.6.9.2  TDLS Peer Key Handshake

11.6.9.3  TDLS Peer Key Handshake security assumptions

11.6.9.4  TDLS Peer Key (TPK) Security Protocol Handshake messages

11.6.9.5  Supplicant state machine procedures

11.6.9.6  Supplicant PeerKey state machine states

11.6.9.7  Supplicant PeerKey state machine variables

11.6.10  RSNA Supplicant key management state machine

11.6.10.1  General

11.6.10.2  Supplicant state machine states

11.6.10.3  Supplicant state machine variables

11.6.11  RSNA Authenticator key management state machine

11.6.11.1  General

11.6.11.2  Authenticator state machine states

11.6.11.3  Authenticator state machine variables

11.6.11.4  Authenticator state machine procedures

11.7  Mapping EAPOL keys to IEEE 802.11 keys

11.7.1  Mapping PTK to TKIP keys

11.7.2  Mapping GTK to TKIP keys
11.7.3 Mapping PTK to CCMP keys ................................................................. 1295
11.7.4 Mapping GTK to CCMP keys ............................................................... 1296
11.7.5 Mapping GTK to WEP-40 keys .......................................................... 1296
11.7.6 Mapping GTK to WEP-104 keys .......................................................... 1296
11.7.7 Mapping IGTK to BIP keys ................................................................. 1296

11.8 Per-frame pseudo-code ............................................................................. 1296
11.8.1 WEP frame pseudo-code ...................................................................... 1296
11.8.2 RSNA frame pseudo-code ...................................................................... 1298
    11.8.2.1 General .......................................................................................... 1298
    11.8.2.2 Per-MSDU/Per-A-MSDU Tx pseudo-code .......................................... 1298
    11.8.2.3 Per-MMPDU Tx pseudo-code ............................................................. 1299
    11.8.2.4 Per-MPDU Tx pseudo-code ................................................................. 1300
    11.8.2.5 Per-MPDU Tx pseudo-code for MMPDU ............................................ 1301
    11.8.2.6 Per-MPDU Rx pseudo-code ................................................................. 1301
    11.8.2.7 Per-MPDU Rx pseudo-code for an MMPDU ....................................... 1302
    11.8.2.8 Per-MSDU/Per-A-MSDU Rx pseudo-code ......................................... 1305
    11.8.2.9 Per-MMPDU Rx pseudo-code ............................................................. 1306

11.9 Authenticated mesh peering exchange (AMPE) ........................................ 1307

12. Fast BSS transition ..................................................................................... 1308

12.1 Overview .................................................................................................. 1308
12.2 Key holders ............................................................................................. 1308
    12.2.1 Introduction ......................................................................................... 1308
    12.2.2 Authenticator key holders ................................................................. 1309
    12.2.3 Supplicant key holders ...................................................................... 1310

12.3 Capability and policy advertisement ........................................................ 1310
12.4 FT initial mobility domain association ...................................................... 1310
    12.4.1 Overview ......................................................................................... 1311
    12.4.2 FT initial mobility domain association in an RSN ................................ 1311
    12.4.3 FT initial mobility domain association in a non-RSN ............................ 1314

12.5 FT Protocol ............................................................................................. 1315
    12.5.1 Overview ......................................................................................... 1315
    12.5.2 Over-the-air FT Protocol authentication in an RSN ............................. 1315
    12.5.3 Over-the-DS FT Protocol authentication in an RSN ............................ 1316
    12.5.4 Over-the-air FT Protocol authentication in a non-RSN ....................... 1319
    12.5.5 Over-the-DS FT Protocol authentication in a non-RSN ....................... 1320

12.6 FT Resource Request Protocol ............................................................... 1321
    12.6.1 Overview ......................................................................................... 1321
    12.6.2 Over-the-air fast BSS transition with resource request ....................... 1321
    12.6.3 Over-the-DS fast BSS transition with resource request ....................... 1323

12.7 FT reassociation ....................................................................................... 1325
    12.7.1 FT reassociation in an RSN ............................................................... 1325
    12.7.2 FT reassociation in a non-RSN ......................................................... 1327

12.8 FT authentication sequence ...................................................................... 1328
    12.8.1 Overview ......................................................................................... 1328
    12.8.2 FT authentication sequence: contents of first message ....................... 1329
    12.8.3 FT authentication sequence: contents of second message .................. 1329
    12.8.4 FT authentication sequence: contents of third message ..................... 1330
    12.8.5 FT authentication sequence: contents of fourth message ................... 1330

13.14.6 Mesh awake window
13.14.7 Power save support
13.14.8 Operation in peer-specific and nonpeer mesh power modes
13.14.8.1 General
13.14.8.2 Operation in active mode
13.14.8.3 Operation in deep sleep mode for nonpeer mesh STAs
13.14.8.4 Operation in light sleep mode for a mesh peering
13.14.8.5 Operation in deep sleep mode for a mesh peering
13.14.8.6 Conditions for Doze state
13.14.9 Mesh peer service periods
13.14.9.1 General
13.14.9.2 Initiation of a mesh peer service period
13.14.9.3 Operation during a mesh peer service period
13.14.9.4 Termination of a mesh peer service period
13.14.10 MCCA use by power saving mesh STA
## 14.7 FHSS PMD sublayer, 1.0 Mb/s

- 1 Mb/s PMD operating specifications, general
- Regulatory requirements
- Operating frequency range
- Number of operating channels
- Operating channel center frequency
- Occupied channel bandwidth
- Minimum hop rate
- Hop sequences
- Unwanted emissions
- Modulation
- Channel data rate
- Frame structure for HS FHSS PHY
- 4GFSK modulation
- 1 Mb/s PMD operating specifications, general
  - Receive to transmit switch time
  - Channel switching/settling time
  - Channel data rate
  - Channel switching/settling time
  - CCA power threshold
  - Operating frequency range
  - Channel data rate
  - Modulation
  - Unwanted emissions
  - Operating channel center frequency
  - Occupied channel bandwidth
  - Minimum hop rate
  - Hop sequences
  - Modulation
  - Channel data rate
  - Frame structure for HS FHSS PHY
  - 4GFSK modulation

## 14.8 FHSS PMD sublayer, 2.0 Mb/s

- Overview
- 4GFSK modulation
- Frame structure for HS FHSS PHY
- Channel data rate
- Input dynamic range
- Receiver sensitivity
- IMp
- Dp

## 14.9 FHSS PHY MIB

- FH PHY attributes
- FH PHY attribute definitions
  - dot1PHYType
  - dot1RegDomainsImplementedValue
  - dot1CurrentRegDomain
  - dot1CurrentPowerState
  - dot1SupportedDataRatesTX
  - dot1SupportedDataRatesRX
  - aMPDUMaxLength
  - dot1TxAntennaImplemented
  - dot1CurrentTxAntenna
  - dot1RxAntennaImplemented
  - dot1DiversitySupportImplemented

19. Extended Rate PHY (ERP) specification

19.1 Overview
19.1.1 General
19.1.2 Introduction
19.1.3 Operational modes
19.1.4 Scope
19.1.5 ERP functions

19.2 PHY-specific service parameter list

19.3 Extended Rate PLCP sublayer
19.3.1 Introduction
19.3.2 PPDU format
19.3.2.1 General
19.3.2.2 Long preamble PPDU format
19.3.2.3 Short preamble PPDU format
19.3.2.4 ERP-OFDM PPDU format
19.3.2.5 DSSS-OFDM long preamble PPDU format
19.3.2.6 DSSS-OFDM PLCP length field calculation
19.3.2.7 Short DSSS-OFDM PLCP PPDU format

19.3.3 PLCP data modulation and rate change
19.3.3.1 Long and short preamble formats
19.3.3.2 ERP-PBCC 22 Mb/s and 33 Mb/s formats
19.3.3.3 ERP-OFDM format
19.3.3.4 Long and short DSSS-OFDM PLCP format

19.3.4 PLCP transmit procedure
19.3.5 CCA
19.3.6 PLCP receive procedure

19.4 ERP PMD operating specifications (general)
19.4.1 Introduction
19.4.2 Regulatory requirements
19.4.3 Operating channel frequencies
19.4.4 Transmit and receive in-band and out-of-band spurious emissions
19.4.5 Slot time
19.4.6 SIFS value
19.4.7 CCA performance
19.4.8 PMD transmit specifications
19.4.8.1 General
19.4.8.2 Transmit power levels
19.4.8.3 Transmit center frequency tolerance
19.4.8.4 Symbol clock frequency tolerance
19.4.8.5 Time of Departure accuracy

19.5 ERP operation specifications
19.5.1 General
19.5.2 Receiver minimum input level sensitivity
19.5.3 Adjacent channel rejection
19.5.4 Receive maximum input level capability
19.5.5 Transmit spectral mask

19.6 ERP-PBCC operation specifications
19.6.1 General
19.6.2 Receiver minimum input level sensitivity
19.6.3 Receiver adjacent channel rejection

19.7 DSSS-OFDM operation specifications
19.7.1 General
19.7.2 Overview
20. High Throughput (HT) PHY specification .............................................................. 1669
  20.1 Introduction ........................................................................................................ 1669
  20.1.1 Introduction to the HT PHY ........................................................................... 1669
  20.1.2 Scope .............................................................................................................. 1669
  20.1.3 HT PHY functions .......................................................................................... 1669
    20.1.3.1 General .................................................................................................... 1669
    20.1.3.2 HT PLCP sublayer .................................................................................. 1670
    20.1.3.3 HT PMD sublayer .................................................................................. 1670
    20.1.3.4 PHY management entity (PLME) ......................................................... 1670

19.7.3 Single carrier to multicarrier transition requirements ........................................... 1648
  19.7.3.1 General ....................................................................................................... 1648
  19.7.3.2 Spectral binding requirement ..................................................................... 1649
  19.7.3.3 Sample-power matching requirement ...................................................... 1655
  19.7.3.4 Transition time alignment ......................................................................... 1655
  19.7.3.5 Single carrier termination ........................................................................... 1657
  19.7.3.6 Transition carrier frequency requirement .................................................... 1657
  19.7.3.7 Transition carrier phase requirement ........................................................... 1658
  19.7.3.8 Transmit modulation accuracy requirement ................................................ 1659

19.8 ERP PLME ........................................................................................................... 1659
  19.8.1 PLME SAP ........................................................................................................ 1659
  19.8.2 MIB .................................................................................................................. 1659
  19.8.3 TXTIME ........................................................................................................... 1661
    19.8.3.1 General .................................................................................................... 1661
    19.8.3.2 ERP-OFDM TXTIME calculations ......................................................... 1661
    19.8.3.3 ERP-PBCC TXTIME calculations ............................................................ 1662
    19.8.3.4 DSSS-OFDM TXTIME calculations ......................................................... 1662
  19.8.4 ERP-OFDM PLCP PSDU definition ................................................................. 1663

19.9 Extended rate PMD sublayer ............................................................................... 1664

  20.3.9.4 HT portion of HT-mixed format preamble ....................................... 1698
  20.3.9.5 HT-greenfield format preamble ......................................................... 1707
20.3.8 Transmission in the upper/lower 20 MHz of a 40 MHz channel .................... 1693
20.3.7 Mathematical description of signals ............................................................... 1691
20.3.6 Timing-related parameters ............................................................................. 1689
20.3.5 Modulation and coding scheme (MCS) ....................................................... 1688
20.3.4 Overview of the PPDU encoding process ..................................................... 1684
20.3.3 Transmitter block diagram ............................................................................ 1683
20.3.2 PPDU format ............................................................................................... 1681
20.3.1 Introduction .................................................................................................. 1681
20.3 HT PLCP sublayer .............................................................................................. 1681
20.2.1 Introduction .................................................................................................. 1671
20.2.2 TXVECTOR and RXVECTOR parameters ................................................... 1671
20.2 HT PHY service interface .................................................................................. 1671
20.2.4 Support for NON_HT formats ................................................................... 1679
20.2.3 Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format ............................................................ 1678
20.2.5 TXSTATUS parameters .............................................................................. 1681
20.2.2 TXVECTOR and RXVECTOR parameters ................................................... 1671
20.2.1 Introduction................................................................................................. 1671
20.2.5 TXSTATUS parameters .............................................................................. 1681
20.2.4 Support for NON_HT formats ................................................................... 1679
20.2 HT PHY service interface .................................................................................. 1671
20.1.4 PPDU formats ............................................................................................. 1670
20.1.3.5 Service specification method ............................................................... 1670
20.1.3 Service specification method .................................................................... 1670
20.1 PPDU formats .................................................................................................. 1670
20.1.2 Pilot subcarriers ......................................................................................... 1670
20.1.1 Introduction ................................................................................................. 1669
20.1.2 Pilot subcarriers ......................................................................................... 1670
20.1.1 Introduction ................................................................................................. 1669
20.1 PPDU formats .................................................................................................. 1670
20.3.17 Transmitter RF delay ................................................................. 1738
20.3.18 Slot time .................................................................................. 1738
20.3.19 Transmit and receive port impedance ........................................ 1738
20.3.20 PMD transmit specification .......................................................... 1739
  20.3.20.1 Transmit spectrum mask .......................................................... 1739
  20.3.20.2 Spectral flatness ..................................................................... 1741
  20.3.20.3 Transmit power .................................................................... 1741
  20.3.20.4 Transmit center frequency tolerance ..................................... 1741
  20.3.20.5 Packet alignment .................................................................. 1741
  20.3.20.6 Symbol clock frequency tolerance ........................................ 1742
  20.3.20.7 Modulation accuracy ............................................................. 1742
  20.3.20.8 Time of Departure accuracy .................................................. 1744
20.3.21 HT PMD receiver specification ...................................................... 1744
  20.3.21.1 Receiver minimum input sensitivity ........................................ 1744
  20.3.21.2 Adjacent channel rejection ..................................................... 1745
  20.3.21.3 Nonadjacent channel rejection .............................................. 1745
  20.3.21.4 Receiver maximum input level .............................................. 1746
  20.3.21.5 CCA sensitivity ................................................................... 1746
  20.3.21.6 Received channel power indicator (RCPI) measurement ........ 1747
  20.3.21.7 Reduced interframe space (RIFS) ......................................... 1747
20.3.22 PLCP transmit procedure ............................................................. 1747
20.3.23 PLCP receive procedure ............................................................... 1750

20.4 HT PLME .................................................................................. 1755
  20.4.1 PLME_SAP sublayer management primitives ............................... 1755
  20.4.2 PHY MIB ............................................................................... 1756
  20.4.3 TXTIME calculation ................................................................. 1760
  20.4.4 PHY characteristics .................................................................. 1761

20.5 HT PMD sublayer ........................................................................ 1762
  20.5.1 Scope and field of application ..................................................... 1762
  20.5.2 Overview of service ................................................................. 1762
  20.5.3 Overview of interactions ........................................................... 1763
  20.5.4 Basic service and options ........................................................... 1763
  20.5.4.1 Status of service primitives .................................................... 1763
  20.5.4.2 PMD_SAP peer-to-peer service primitives ............................... 1763
  20.5.4.3 PMD_SAP sublayer-to-sublayer service primitives .................. 1763
  20.5.4.4 PMD_SAP service primitive parameters ................................. 1764
  20.5.5 PMD_SAP detailed service specification ..................................... 1765
    20.5.5.1 Introduction to PMD_SAP service specification ..................... 1765
    20.5.5.2 PMD_DATA.request .......................................................... 1765
    20.5.5.3 PMD_DATA.indication ......................................................... 1765
    20.5.5.4 PMD_TXSTART.request ...................................................... 1766
    20.5.5.5 PMD_TXEND.request ......................................................... 1766
    20.5.5.6 PMD_TXEND.confirm ......................................................... 1767
    20.5.5.7 PMD_TXPOWER.LVL.request ............................................ 1767
    20.5.5.8 PMD_RSSI.indication .......................................................... 1768
    20.5.5.9 PMD_RCPI.indication .......................................................... 1768
    20.5.5.10 PMD_TX_PARAMETERS.request ...................................... 1769
    20.5.5.11 PMD_CBW_OFFSET.indication .......................................... 1769
    20.5.5.12 PMD_CHAN_MAT.indication .......................................... 1770
    20.5.5.13 PMD_FORMAT.indication ............................................... 1770

20.6 Parameters for HT MCSs ................................................................. 1771

Annex A (informative) Bibliography ........................................................... 1781
Annex B (normative) Protocol Implementation Conformance Statement (PICS) proforma.......................... 1785

B.1 Introduction................................................................................................................ 1785
B.2 Abbreviations and special symbols............................................................................. 1785
  B.2.1 Symbols for Status column .............................................................................. 1785
  B.2.2 General abbreviations for Item and Support columns ........................................ 1785
B.3 Instructions for completing the PICS proforma.............................................................. 1786
  B.3.1 General structure of the PICS proforma............................................................. 1786
  B.3.2 Additional information ..................................................................................... 1787
  B.3.3 Exception information ..................................................................................... 1787
  B.3.4 Conditional status ........................................................................................... 1787
B.4 PICS proforma—IEEE Std 802.11-2012...................................................................... 1788
  B.4.1 Implementation identification ........................................................................... 1788
  B.4.2 Protocol summary ............................................................................................ 1789
  B.4.3 IUT configuration............................................................................................. 1789
  B.4.4 MAC protocol .................................................................................................. 1790
  B.4.5 Frequency hopping (FH) PHY functions ............................................................ 1800
  B.4.6 Direct sequence PHY functions ....................................................................... 1803
  B.4.7 IR baseband PHY functions ........................................................................... 1806
  B.4.8 OFDM PHY functions .................................................................................... 1809
  B.4.9 High Rate, direct sequence PHY functions ...................................................... 1819
B.4.10 Regulatory Domain Extensions........................................................................... 1823
  B.4.11 ERP functions ................................................................................................ 1824
  B.4.12 Spectrum management extensions .................................................................... 1828
  B.4.13 Operating Classes extensions ......................................................................... 1830
  B.4.14 QoS base functionality .................................................................................. 1830
  B.4.15 QoS enhanced distributed channel access (EDCA) ......................................... 1831
  B.4.16 QoS hybrid coordination function (HCF) controlled channel access (HCCA) ................................................................................................. 1832
B.4.17 Radio Management extensions ........................................................................... 1832
B.4.18 DSE functions .................................................................................................. 1837
B.4.19 High-throughput (HT) features .......................................................................... 1838
B.4.20 Tunneled direct-link setup extensions ................................................................ 1845
B.4.21 WNM extensions ............................................................................................ 1846
B.4.22 Interworking (IW) with external networks extensions ....................................... 1849
B.4.23 Mesh protocol capabilities .............................................................................. 1850

Annex C (normative) ASN.1 encoding of the MAC and PHY MIB................................................. 1855

C.1 General...................................................................................................................... 1855
C.2 Guidelines for 802.11 MIB Authors/Editors ................................................................ 1855
C.3 MIB Detail ................................................................................................................. 1855

Annex D (normative) Regulatory references............................................................................. 2287

D.1 External regulatory references .................................................................................... 2287
D.2 Radio performance specifications ................................................................................ 2289
  D.2.1 Transmit and receive in-band and out-of-band spurious emissions ...................... 2289
  D.2.2 Transmit power levels ..................................................................................... 2289
  D.2.3 Transmit spectrum mask .................................................................................. 2289
  D.2.4 Transmit Mask M ............................................................................................ 2291
  D.2.5 CCA-ED threshold ......................................................................................... 2292
Annex E (normative) Country elements and operating classes ................................................................. 2293

E.1 Country information and operating classes .......................................................... 2293
E.2 Band-specific operating requirements ...................................................................... 2302
E.2.1 General ............................................................................................................. 2302
E.2.2 3650–3700 MHz in the United States .............................................................. 2302
E.2.3 5.9 GHz band in the United States (5.850–5.925 GHz) ................................... 2303
E.2.4 5.9 GHz band in Europe (5.855–5.925 GHz) ................................................... 2303

Annex F (normative) HT LDPC matrix definitions................................................................................... 2304

Annex G (normative) Frame exchange sequences..................................................................................... 2307

G.1 General..................................................................................................................... 2307
G.2 Basic sequences ............................................................................................................. 2309
G.3 EDCA and HCCA sequences ..................................................................................... 2310
G.4 HT sequences................................................................................................................. 2312

Annex H (normative) Usage of Ethertype 89-0d................................................................................... 2320

Annex I (informative) Hopping sequences............................................................................................. 2321

Annex J (informative) Formal description of a subset of MAC operation................................................ 2334

J.1 Status of this annex ........................................................................................................ 2334
J.2 Overview....................................................................................................................... 2334
J.3 Introduction to the MAC formal description .................................................................... 2337
J.3.1 Fundamental assumptions .................................................................................... 2337
J.3.2 Notation conventions ............................................................................................ 2337
J.3.3 Modeling techniques ............................................................................................. 2338
J.4 Data type and operator definitions for the MAC state machines................................... 2339
J.5 State machines for MAC STAs ................................................................................ 2387
J.6 State machines for MAC AP ..................................................................................... 2464

Annex K (informative) High Rate PHY/FH interoperability ................................................................. 2535

K.1 Status of this Annex ....................................................................................................... 2535
K.2 General......................................................................................................................... 2535

Annex L (informative) Examples of encoding a frame for OFDM PHYs .............................................. 2536

L.1 Example 1 - BCC encoding .................................................................................... 2536
L.1.1 Introduction .......................................................................................................... 2536
L.1.2 The message for the BCC example .................................................................... 2537
L.1.3 Generation of the preamble ................................................................................. 2538
L.1.4 Generation of the SIGNAL field ....................................................................... 2543
L.1.5 Generating the DATA bits for the BCC example ................................................. 2547
L.1.6 Generating the first DATA symbol for the BCC example .................................. 2551
L.1.7 Generating the additional DATA symbols .......................................................... 2556
L.1.8 The entire packet for the BCC example ............................................................... 2556
L.2 Generating encoded DATA bits—LDPC example 1 ................................................. 2565
L.2.1 The message for LDPC example 1 ...................................................................... 2565
L.2.2 Prepending the SERVICE field for LDPC example 1 ....................................... 2566
L.2.3 Scrambling LDPC example 1 .............................................................................. 2568
Annex M (informative) RSNA reference implementations and test vectors

M.1 TKIP temporal key mixing function reference implementation and test vector
   M.1.1 TKIP temporal key mixing function reference implementation
   M.1.2 Test vectors

M.2 Michael reference implementation and test vectors
   M.2.1 Michael test vectors
   M.2.2 Sample code for Michael

M.3 PRF reference implementation and test vectors
   M.3.1 PRF reference code
   M.3.2 PRF test vectors

M.4 Suggested pass-phrase-to-PSK mapping
   M.4.1 Introduction
   M.4.2 Reference implementation
   M.4.3 Test vectors

M.5 Suggestions for random number generation
   M.5.1 General
   M.5.2 Software sampling
   M.5.3 Hardware-assisted solution

M.6 Additional test vectors
   M.6.1 Notation
   M.6.2 WEP cryptographic encapsulation
   M.6.3 TKIP test vector
   M.6.4 CCMP test vector
   M.6.5 PRF test vectors

M.7 Key hierarchy test vectors for pairwise keys
   M.7.1 General
   M.7.2 CCMP pairwise key derivation
   M.7.3 TKIP pairwise key derivation

M.8 Test vectors for AES-128-CMAC

M.9 Management frame protection test vectors
   M.9.1 BIP with broadcast Deauthentication frame
   M.9.2 CCMP with unicast Deauthentication frame

M.10 SAE test vector

Annex N (informative) Admission control

N.1 Example use of TSPEC for admission control
N.2 Recommended practices for contention-based admission control
   N.2.1 Use of ACM (admission control mandatory) subfield
   N.2.2 Deriving medium time

N.3 Guidelines and reference design for sample scheduler and admission control unit
   N.3.1 Guidelines for deriving service schedule parameters
Annex V (informative) Interworking with external networks ................................................................. 2672

   V.1 General .................................................................................................................................. 2672
   V.2 Network discovery and selection ......................................................................................... 2672
       V.2.1 General .......................................................................................................................... 2672
       V.2.2 Airport .......................................................................................................................... 2672
       V.2.3 Shopping ....................................................................................................................... 2673
       V.2.4 Sales meeting ............................................................................................................... 2674
       V.2.5 Museum ...................................................................................................................... 2674
       V.2.6 Emergency call .......................................................................................................... 2675
       V.2.7 Emergency alert .......................................................................................................... 2676
   V.3 QoS mapping guidelines for interworking with external networks .................................... 2676
       V.3.1 General ........................................................................................................................ 2676
       V.3.2 Determination of the mapping for a STA .................................................................... 2677
       V.3.3 Example of QoS mapping from different networks .................................................... 2677
   V.4 Interworking and SSPN interface support ......................................................................... 2679
       V.4.1 General ........................................................................................................................ 2679
       V.4.2 SSPN interface parameters ......................................................................................... 2680
   V.5 Interworking with external networks and emergency call support ................................. 2683
       V.5.1 General ........................................................................................................................ 2683
       V.5.2 Background on emergency call support over IEEE 802.11 infrastructure ............... 2684
       V.5.3 System aspects for emergency call support ................................................................. 2684
       V.5.4 Description of the Expedited Bandwidth Request element ........................................ 2686
       V.5.5 Access to emergency services in an RSN ................................................................. 2686
   V.6 Peer information ................................................................................................................... 2687

Annex W (informative) Mesh BSS operation .................................................................................... 2688

   W.1 Clarification of Mesh Data frame format ........................................................................ 2688
   W.2 Operational considerations for interworking ................................................................. 2688
       W.2.1 Formation and maintenance of the IEEE 802.1D spanning tree ............................. 2688
   W.3 Power save parameters selection ...................................................................................... 2688
       W.3.1 General ........................................................................................................................ 2688
       W.3.2 Selecting the mesh power mode based on traffic load .............................................. 2689
       W.3.3 Scanning of mesh BSSs .............................................................................................. 2689
       W.3.4 Default parameters .................................................................................................... 2689
       W.3.5 MSDU forwarding in an MBSS containing mesh STAs in light or deep sleep mode . 2690
       W.3.6 Synchronization maintenance of mesh STAs in deep sleep mode ............................ 2690
   W.4 SIV key wrapping test vector ............................................................................................ 2690
   W.5 Airtime link metric usage example .................................................................................... 2692
   W.6 Generation of proactive PREPs in proactive PREQ mechanism of HWMP .................. 2692
       W.6.1 General ........................................................................................................................ 2692
       W.6.2 Additions to forwarding information ........................................................................... 2693
       W.6.3 Actions when sending data frames as source mesh STA ......................................... 2693
       W.6.4 Actions on receipt of proactive PREQ ....................................................................... 2693
       W.6.5 Generation of proactive PREPs ................................................................................ 2693
   W.7 Generation of PREQs in proactive RANN mechanism of HWMP .................................. 2694
       W.7.1 General ........................................................................................................................ 2694
       W.7.2 Additions to forwarding information ........................................................................... 2694
       W.7.3 Actions when sending data frames as source mesh STA ......................................... 2694
       W.7.4 Actions on receipt of proactive RANN ..................................................................... 2694
       W.7.5 Actions on receipt of PREP ....................................................................................... 2695

1. Overview

1.1 Scope

The scope of this standard is to define one medium access control (MAC) and several physical layer (PHY) specifications for wireless connectivity for fixed, portable, and moving stations (STAs) within a local area.

1.2 Purpose

The purpose of this standard is to provide wireless connectivity for fixed, portable, and moving stations within a local area. This standard also offers regulatory bodies a means of standardizing access to one or more frequency bands for the purpose of local area communication.

1.3 Supplementary information on purpose

Specifically, this standard

- Describes the functions and services required by an IEEE 802.11™-compliant device to operate within independent and infrastructure networks as well as the aspects of STA mobility (transition) within those networks.
- Describes the functions and services that allow an IEEE 802.11-compliant device to communicate directly with another such device outside of an independent or infrastructure network.
— Defines the MAC procedures to support the MAC service data unit (MSDU) delivery services.
— Defines several PHY signaling techniques and interface functions that are controlled by the IEEE 802.11 MAC.
— Permits the operation of an IEEE 802.11-conformant device within a wireless local area network (WLAN) that may coexist with multiple overlapping IEEE 802.11 WLANs.
— Describes the requirements and procedures to provide data confidentiality of user information and MAC management information being transferred over the wireless medium (WM) and authentication of IEEE 802.11-conformant devices.
— Defines mechanisms for dynamic frequency selection (DFS) and transmit power control (TPC) that may be used to satisfy regulatory requirements for operation in any band.
— Defines the MAC procedures to support local area network (LAN) applications with quality-of-service (QoS) requirements, including the transport of voice, audio, and video.
— Defines mechanisms and services for wireless network management of STAs that include BSS transition management, channel usage and coexistence, collocated interference reporting, diagnostic, multicast diagnostic and event reporting, flexible multicast, efficient beacon mechanisms, proxy ARP advertisement, location, timing measurement, directed multicast, extended sleep modes, traffic filtering, and management notification.
— Defines functions and procedures aiding network discovery and selection by STAs, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.
— Defines the MAC procedures that are necessary for wireless multi-hop communication to support wireless LAN mesh topologies.

1.4 Word Usage

In this document, the word shall is used to indicate a mandatory requirement. The word should is used to indicate a recommendation. The word may is used to indicate a permissible action. The word can is used for statements of possibility and capability.

2. Normative references

The following referenced documents are indispensable for the application of this standard (i.e., they must be understood and used; therefore, each referenced document is cited in the text and its relationship to this document is explained). For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments or corrigenda) applies.

3. Definitions, acronyms, and abbreviations

3.1 Definitions

For the purposes of this standard, the following terms and definitions apply. The IEEE Standards Dictionary: Glossary of Terms & Definitions should be referenced for terms not defined in this clause.\(^{10}\)

access category (AC): A label for the common set of enhanced distributed channel access (EDCA) parameters that are used by a quality-of-service (QoS) station (STA) to contend for the channel in order to transmit medium access control (MAC) service data units (MSDUs) with certain priorities.

access control: The prevention of unauthorized usage of resources.

access point (AP): An entity that contains one station (STA) and provides access to the distribution services, via the wireless medium (WM) for associated STAs.

access point (AP) path: Path between two tunneled direct-link setup (TDLS) peer stations (STAs) via the AP with which the STAs are currently associated.

\(^{8}\)The numbers in brackets correspond to the numbers of the bibliography in Annex A.

\(^{9}\)ITU publications are available from the International Telecommunications Union (http://www.itu.int/).

\(^{10}\)The IEEE Standards Dictionary: Glossary of Terms & Definitions is available at http://shop.ieee.org/.
**access point (AP) reachability:** An AP is reachable by a station (STA) if preauthentication messages can be exchanged between the STA and the target AP via the distribution system (DS).

NOTE—Preauthentication is defined in 11.5.9.2.11

**active mode:** A mesh power mode in which the mesh station (STA) operates in the Awake state towards a neighbor mesh STA.

**additional authentication data (AAD):** Data that are not encrypted, but are cryptographically protected.

**ad hoc network:** Often used as a vernacular term for an independent basic service set (IBSS).

**admission control:** An algorithm to ensure that admittance of a new flow into a resource constrained network does not violate parameterized service commitments made by the network to admitted flows.

**aggregate medium access control (MAC) protocol data unit (A-MPDU):** A structure containing multiple MPDUs, transported as a single physical layer convergence procedure (PLCP) service data unit (PSDU) by the physical layer (PHY).

**aggregate medium access control (MAC) service data unit (A-MSDU):** A structure containing multiple MSDUs, transported within a single (unfragmented) data medium access control (MAC) protocol data unit (MPDU).

**aggregate medium access control (MAC) service data unit (A-MSDU) subframe:** A portion of an A-MSDU containing a header and associated MSDU.

**aggregated schedule:** The aggregation of delivery and/or poll schedules by the quality-of-service (QoS) access point (AP) for a particular QoS station (STA) into a single service period (SP).

**antenna connector:** The measurement point of reference for radio frequency (RF) measurements in a station (STA). The antenna connector is the point in the STA architecture representing the input of the receiver (output of the antenna) for radio reception and the input of the antenna (output of the transmitter) for radio transmission. In systems using multiple antennas or antenna arrays, the antenna connector is a virtual point representing the aggregate output of (or input to) the multiple antennas. In systems using active antenna arrays with processing, the antenna connector is the output of the active array, which includes any processing gain of the active antenna subsystem.

**antenna selection (ASEL) receiver:** A station (STA) that performs receive ASEL.

**antenna selection (ASEL) transmitter:** A station (STA) that performs transmit ASEL.

**association:** The service used to establish access point/station (AP/STA) mapping and enable STA invocation of the distribution system services (DSSs).

**authentication:** The service used to establish the identity of one station (STA) as a member of the set of STAs authorized to associate with another STA.

**authentication and key management (AKM) suite:** A set of one or more algorithms designed to provide authentication and key management, either individually or in combination with higher layer authentication and key management algorithms outside the scope of this standard.

---

11 Notes in text, tables, and figures of a standard are given for information only and do not contain requirements needed to implement the standard.
**Authentication Server (AS):** An entity that provides an authentication service to an Authenticator. This service determines, from the credentials provided by the Supplicant, whether the Supplicant is authorized to access the services provided by the Authenticator. (IEEE Std 802.1X-2004)

**Authenticator:** An entity at one end of a point-to-point LAN segment that facilitates authentication of the entity attached to the other end of that link. (IEEE Std 802.1X-2004)

**Authenticator address (AA):** The medium access control (MAC) address of the IEEE 802.1X Authenticator.

**authorization:** The act of determining whether a particular right, such as access to a resource, is granted to an entity.

NOTE—See IETF RFC 2903 [B32].

**authorized:** To be explicitly allowed.

**average noise power indicator (ANPI):** A medium access control (MAC) indication of the average noise plus interference power measured when the channel is idle as defined by three simultaneous conditions: 1) the Virtual Carrier Sense (CS) mechanism indicates idle channel, 2) the station (STA) is not transmitting a frame, and 3) the STA is not receiving a frame.

**azimuth:** The horizontal orientation of the front surface of a station or of a radio antenna system’s main lobe measured clockwise from true north.

**base channel:** Channel on which the tunneled direct-link setup (TDLS) peer station (STA) is associated with an access point (AP).

**basic service area (BSA):** The area containing the members of a basic service set (BSS). It might contain members of other BSSs.

**basic service set (BSS):** A set of stations (STAs) that have successfully synchronized using the JOIN service primitives and one STA that has used the START primitive. Alternatively, a set of STAs that have used the START primitive specifying matching mesh profiles where the match of the mesh profiles has been verified via the scanning procedure. Membership in a BSS does not imply that wireless communication with all other members of the BSS is possible.

**basic service set (BSS) transition:** A station (STA) movement from one BSS to another BSS in the same extended service set (ESS).

**beamformee:** A station (STA) that receives a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

**beamformer:** A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) using a beamforming steering matrix.

**beamforming:** A spatial filtering mechanism used at a transmitter to improve the received signal power or signal-to-noise ratio (SNR) at an intended receiver. Syn: beam steering.

**big endian:** The concept that, for a given multi-octet numeric representation, the most significant octet has the lowest address.

---

12Information on references can be found in Clause 2.
13The numbers in brackets correspond to the numbers of the bibliography in Annex A.
14Description of these primitives can be found in 6.3.4.
broadcast address: A unique group address that specifies all stations (STAs).

BSS Max idle period: A time period during which the access point (AP) does not disassociate a station (STA) due to nonreceipt of frames from that STA.

calibration initiator: A station (STA) that initiates a calibration sequence.

calibration responder: A station (STA) that transmits during a calibration sequence in response to a transmission by a calibration initiator.

candidate peer mesh station (STA): A neighbor mesh STA to which a mesh peering has not been established but meets eligibility requirements to become a peer mesh STA.

channel: An instance of communications medium use for the purpose of passing protocol data units (PDUs) between two or more stations (STAs).

channel spacing: The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter.

cipher suite: A set of one or more algorithms, designed to provide data confidentiality, data authenticity or integrity, and/or replay protection.

clear channel assessment (CCA) function: That logical function in the physical layer (PHY) that determines the current state of use of the wireless medium (WM).

collocated interference: Interference that is caused by another radio or station (STA) emitting radio energy located in the same physical device as the reporting STA, where the reported characteristics of the interference are known a priori without interference detection, measurement, or characterization by the reporting STA.

collocated radio: A radio capable of emitting radio-frequency energy located in the same physical device as the reporting station (STA), where the radio’s type and some link characteristics are known without signal detection or measurement by the reporting STA.

configuration profile: A collection of parameters identified by a profile identifier (ID) that represent a current or available configuration of a station (STA).

contention-free period (CFP): The time period during the operation of a point coordination function (PCF) when the right to transmit is assigned to stations (STAs) solely by a point coordinator (PC), allowing frame exchanges to occur between members of the basic service set (BSS) without contention for the wireless medium (WM).

contention period (CP): The time period outside of the contention-free period (CFP) in a point-coordinated basic service set (BSS). In a BSS where there is no point coordinator (PC), this corresponds to the entire time of operation of the BSS.

controlled access phase (CAP): A time period when the hybrid coordinator (HC) maintains control of the medium, after gaining medium access by sensing the channel to be idle for a point coordination function (PCF) interframe space (PIFS) duration. It might span multiple consecutive transmission opportunities (TXOPs) and can contain polled TXOPs.

coordination function: The logical function that determines when a station (STA) operating within a basic service set (BSS) is permitted to transmit protocol data units (PDUs) via the wireless medium (WM). The coordination function within a BSS might have one hybrid coordination function (HCF), or it might have
one HCF and one point coordination function (PCF) and has one distributed coordination function (DCF). A quality-of-service (QoS) BSS has one DCF and one HCF.

**contention-free (CF) pollable**: A station (STA) that is able to respond to a CF poll with a data frame if such a frame is queued and able to be generated.

**Counter mode with Cipher-block chaining Message authentication code (CCM)**: A symmetric key block cipher mode providing confidentiality using counter mode (CTR) and data origin authenticity using cipher-block chaining message authentication code (CBC-MAC).

NOTE—See IETF RFC 3610.

**cryptographic encapsulation**: The process of generating the cryptographic payload from the plaintext data. This comprises the cipher text as well as any associated cryptographic state required by the receiver of the data, e.g., initialization vectors (IVs), sequence numbers, message integrity codes (MICs), key identifiers.

**data confidentiality**: A property of information that prevents disclosure to unauthorized individuals, entities, or processes.

**deauthentication service**: The service that voids an existing authentication relationship.

**decapsulate**: To recover an unprotected frame from a protected one.

**decapsulation**: The process of generating plaintext data by decapsulating an encapsulated frame.

**deep sleep mode**: A mesh power mode in which the mesh station (STA) operates either in the Awake state or in the Doze state towards a neighbor mesh STA, and is not expected to receive beacons from this neighbor mesh STA.

**delivery-enabled access category (AC)**: A quality-of-service (QoS) access point (AP) AC where the AP is allowed to use enhanced distributed channel access (EDCA) to deliver traffic from the AC to a QoS station (STA) in an unscheduled service period (SP) triggered by the STA.

**dependent station (STA)**: A STA that is not registered and whose operational parameters are dictated by messages it receives from an enabling STA. Once enabled by the dynamic STA enablement (DSE) process, a dependent STA’s continued operation becomes contingent upon being able to receive messages from its enabling STA over the air.

**destination mesh station (STA)**: A mesh STA that is the final destination of a MAC service data unit (MSDU). This mesh STA might reside in a proxy mesh gate that might forward the MSDU to a STA outside of the MBSS. A destination mesh STA might be an end station as defined in IEEE Std 802.1.

**directed frame**: See: individually addressed.

**direct link**: A bidirectional link from one quality-of-service (QoS) station (STA) to another QoS STA operating in the same infrastructure QoS basic service set (BSS) that does not pass through a QoS access point (AP). Once a direct link has been set up, all frames between the two QoS STAs are exchanged directly.

**directed multicast service (DMS)**: A service in which the access point (AP) transmits group addressed frames as individually addressed frames to the requesting non-AP station (STA).

**disassociation service**: The service that removes an existing association.
distributed coordination function (DCF): A class of coordination function where the same coordination function logic is active in every station (STA) in the basic service set (BSS) whenever the network is in operation.

distribution service: The service that, by using association information, delivers medium access control (MAC) service data units (MSDUs) within the distribution system (DS).

distribution system (DS): A system used to interconnect a set of basic service sets (BSSs) and integrated local area networks (LANs) to create an extended service set (ESS).

distribution system medium (DSM): The medium or set of media used by a distribution system (DS) for communications between access points (APs), mesh gates, and portals of an extended service set (ESS).

distribution system service (DSS): The set of services provided by the distribution system (DS) that enable the medium access control (MAC) to transport MAC service data units (MSDUs) between stations (STAs) that are not in direct communication with each other over a single instance of the wireless medium (WM). These services include transport of MSDUs between the access points (APs) of basic service sets (BSSs) within an extended service set (ESS), transport of MSDUs between portals and BSSs within an ESS, transport of MSDUs between mesh gates in the same or different mesh basic service sets (MBSSs), transport of MSDUs between mesh gates and APs, transport of MSDUs between mesh gates and portals, and transport of MSDUs between STAs in the same BSS in cases where the MSDU has a group destination address or where the destination is an individual address and the STA is associated with an AP.

NOTE—DSSs are provided between pairs of MACs not on the same instance of the WM.

downlink: A unidirectional link from an access point (AP) to one or more non-AP stations (STAs).

dynamic frequency selection (DFS): Facilities mandated to satisfy requirements in some regulatory domains for radar detection and uniform channel spreading in the 5 GHz band. These facilities might also be used for other purposes, such as automatic frequency planning.

dynamic frequency selection (DFS) owner: A station (STA) in an independent basic service set (IBSS) or off-channel TDLS direct link that takes responsibility for selecting the next channel after radar is detected operating in a channel. Due to the nature of IBSSs, it cannot be guaranteed that there is a single DFS owner at any particular time and the protocol is robust to this situation.

dynamic station (STA) enablement (DSE): The process by which an enabling STA grants permission and dictates operational procedures to STAs that are subject to its control.

effective isotropic radiated power (EIRP): The equivalent power of a transmitted signal in terms of an isotropic (omnidirectional) radiator. The EIRP equals the product of the transmitter power and the antenna gain (reduced by any coupling losses between the transmitter and antenna).

emergency alert system (EAS): A U.S. national public warning system.

enabling station (STA): A registered STA that has the authority to control when and how a dependent STA can operate. An enabling STA communicates an enabling signal to its dependents over the air. An enabling STA chooses whether other dynamic STA enablement (DSE) messages are exchanged over the air, over the distribution system (DS), or by mechanisms that rely on transport via higher layers.

encapsulate: To construct a protected frame from an unprotected frame.

encapsulation: The process of generating a protected frame by encapsulating plaintext data.
enhanced distributed channel access (EDCA): The prioritized carrier sense multiple access with collision avoidance (CSMA/CA) access mechanism used by quality-of-service (QoS) stations (STAs) in a QoS basic service set (BSS). This access mechanism is also used by the QoS access point (AP) and operates concurrently with hybrid coordination function (HCF) controlled channel access (HCCA).

enhanced distributed channel access function (EDCAF): A logical function in a quality-of-service (QoS) station (STA) that determines, using enhanced distributed channel access (EDCA), when a frame in the transmit queue with the associated access category (AC) is permitted to be transmitted via the wireless medium (WM). There is one EDCAF per AC.

extended service area (ESA): The area within which members of an extended service set (ESS) can communicate. An ESA is larger than or equal to a basic service area (BSA) and might involve several basic service sets (BSSs) in overlapping, disjointed, or both configurations.

extended service set (ESS): A set of one or more interconnected basic service sets (BSSs) that appears as a single BSS to the logical link control (LLC) layer at any station (STA) associated with one of those BSSs.

extended service set (ESS) transition: A station (STA) movement from one basic service set (BSS) in one ESS to another BSS in a different ESS.

fast basic service set (BSS) transition: A station (STA) movement that is from one BSS in one extended service set (ESS) to another BSS within the same ESS and that minimizes the amount of time that data connectivity is lost between the STA and the distribution system (DS).

fast basic service set (BSS) transition (FT) 4-Way Handshake: A pairwise key management protocol used during FT initial mobility domain association. This handshake confirms mutual possession of a pairwise master key, the PMK-R1, by two parties and distributes a group temporal key (GTK).

fast basic service set (BSS) transition (FT) initial mobility domain association: The first association or first reassociation procedure within a mobility domain, during which a station (STA) indicates its intention to use the FT procedures.

fixed station (STA): A STA that is physically attached to a specific location. In licensed bands, a fixed STA might be authorized to operate only at a specific location.

flexible multicast service (FMS): A service that enables a non-access-point (non-AP) station (STA) to request a multicast delivery interval longer than the delivery traffic indication map (DTIM) interval for the purposes of lengthening the period of time a STA can be in a power save state.

flexible multicast stream identifier (FMSID): An identifier assigned by the access point (AP) to a particular group addressed stream subsequent to a successful FMS Request.

flexible multicast stream (FMS) stream: A succession of frames transmitted by the access point (AP) that correspond to a single flexible multicast stream identifier (FMSID).

flexible multicast service (FMS) stream set: A collection of FMS streams identified by an FMS Token, used during the FMS Request procedure.

forwarding information: The information maintained by a mesh station (STA) that allows the mesh STA to perform its path selection and forwarding functions.

fragmentation: The process of segmenting a medium access control (MAC) service data unit (MSDU) or MAC management protocol data unit (MMPDU) into a sequence of smaller MAC protocol data units.
(MPDUs) prior to transmission. The process of recombining a set of fragment MPDUs into an MSDU or MMPDU is known as defragmentation. These processes are described in 5.8.1.9 of ISO/IEC 7498-1:1994.

**Gaussian frequency shift keying (GFSK):** A modulation scheme in which the data are first filtered by a Gaussian filter in the baseband and then modulated with a simple frequency modulation.

**group:** The entities in a wireless network, e.g., an access point (AP) and its associated stations (STAs), or all the STAs in an independent basic service set (IBSS) network.

**group address:** A medium access control (MAC) address that has the group bit equal to 1. Syn: multicast address.

**group addressed:** When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with a group address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with a group address in the Address 1 field. Syn: multicast.

**Group Key Handshake:** A group key management protocol defined by this standard. It is used only to issue a new group temporal key (GTK) to peers with whom the local station (STA) has already formed security associations.

**group master key (GMK):** An auxiliary key that might be used to derive a group temporal key (GTK).

**group temporal key (GTK):** A random value, assigned by the group source, which is used to protect group addressed medium access control (MAC) protocol data units (MPDUs) from that source. The GTK might be derived from a group master key (GMK).

**hidden station (STA):** A STA whose transmissions are not detected using carrier sense (CS) by a second STA, but whose transmissions interfere with transmissions from the second STA to a third STA.

**homogenous extended service set (ESS):** A collection of basic service sets (BSSs), within the same extended service set (ESS), in which every subscription service provider network (SSPN) or other external network reachable at one BSS is reachable at all of them.

**hybrid coordination function (HCF):** A coordination function that combines and enhances aspects of the contention-based and contention-free access methods to provide quality-of-service (QoS) stations (STAs) with prioritized and parameterized QoS access to the wireless medium (WM), while continuing to support non-QoS STAs for best-effort transfer. The HCF includes the functionality provided by both enhanced distributed channel access (EDCA) and HCF controlled channel access (HCCA). The HCF is compatible with the distributed coordination function (DCF) and the point coordination function (PCF). It supports a uniform set of frame formats and exchange sequences that STAs might use during both the contention period (CP) and the contention-free period (CFP).

**hybrid coordinator (HC):** A type of coordinator, defined as part of the quality-of-service (QoS) facility, that implements the frame exchange sequences and medium access control (MAC) service data unit (MSDU) handling rules defined by the hybrid coordination function (HCF). The HC operates during both the contention period (CP) and contention-free period (CFP). The HC performs bandwidth management including the allocation of transmission opportunities (TXOPs) to QoS stations (STAs). The HC is collocated with a QoS access point (AP).

**hybrid coordination function (HCF) controlled channel access (HCCA):** The channel access mechanism utilized by the hybrid coordinator (HC) to coordinate contention-free media use by quality-of-service (QoS) stations (STAs) for downlink individually addressed, uplink, and direct-link transmissions.
idle power indicator (IPI): A physical layer (PHY) indication of the total channel power (noise and interference) as measured in the channel at the receiving antenna connector while the station (STA) is idle, i.e., neither transmitting nor receiving a frame.

IEEE 802.1X authentication: Extensible Authentication Protocol (EAP) authentication transported by the IEEE 802.1X protocol.

independent basic service set (IBSS): A basic service set (BSS) that forms a self-contained network, and in which no access to a distribution system (DS) is available.

individual address: A medium access control (MAC) address in which the group bit is 0. Syn: directed address, unicast address.

individually addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with an individual address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with an individual address in the Address 1 field. Syn: directed, unicast.

infrastructure: The infrastructure includes the distribution system medium (DSM), access point (AP), and portal entities. It is also the logical location of distribution and integration service functions of an extended service set (ESS). An infrastructure contains one or more APs and zero or more portals in addition to the distribution system (DS).

infrastructure authorization information: The information that specifies the access rights of the user of a non-access-point (non-AP) station (STA). This information might include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality-of-service (QoS) configuration information, or the accounting policy to be applied by the infrastructure.

integration service: The service that enables delivery of medium access control (MAC) service data units (MSDUs) between the distribution system (DS) and a local area network (LAN) (via a portal).

integrity GTK (IGTK): A random value, assigned by the broadcast/multicast source STA, which is used to protect group addressed medium access control (MAC) management protocol data units (MMPDUs) from that source STA.

light sleep mode: A mesh power mode in which the mesh station (STA) operates either in the Awake state or in the Doze state towards a neighbor mesh STA, and is expected to receive beacons from this neighbor peer mesh STA.

link: In the context of an IEEE 802.11 medium access control (MAC) entity, a physical path consisting of exactly one traversal of the wireless medium (WM) that is used to transfer an MAC service data unit (MSDU) between two stations (STAs).

link margin: Ratio of the received signal power to the minimum required by the station (STA). The STA might incorporate rate information and channel conditions, including interference, into its computation of link margin. The specific algorithm for computing the link margin is implementation dependent.

link metric: A criterion used to characterize the performance, quality, and eligibility of a link.

little endian: The concept that, for a given multi-octet numeric representation, the least significant octet has the lowest address.

liveness: A demonstration that the peer is actually participating in this instance of communication.
**location configuration information (LCI):** As defined in IETF RFC 3825: includes latitude, longitude, and altitude, with resolution indicators for each.

**location subject local:** The term used when a location request is for the location of the requesting STA, i.e., when the requesting STA asks, “Where am I?”

**location subject remote:** The term used when a location request is for the location of the reporting STA, i.e., when the requesting STA asks, “Where are you?”

**location subject third party:** The term used when the location request is for the location of a station (STA) other than the requesting STA or the requested STA, (i.e., when the requesting STA asks, “Where is he/she?”)

**master session key (MSK):** Keying material that is derived between the Extensible Authentication Protocol (EAP) peer and exported by the EAP method to the Authentication Server (AS).  
NOTE—In this standard, this key is at least 64 octets in length.

**medium access control (MAC) management protocol data unit (MMPDU):** The unit of data exchanged between two peer MAC entities, using services of the physical layer (PHY), to implement the MAC management protocol.

**medium access control (MAC) protocol data unit (MPDU):** The unit of data exchanged between two peer MAC entities using the services of the physical layer (PHY). Syn: frame.

**medium access control (MAC) service data unit (MSDU):** Information that is delivered as a unit between MAC service access points (SAPs).

**mesh basic service set (MBSS):** A basic service set (BSS) that forms a self-contained network of mesh stations (STAs) that use the same mesh profile. An MBSS contains zero or more mesh gates, and can be formed from mesh STAs that are not in direct communication.

**mesh facility:** The set of enhanced functions, channel access rules, frame formats, mutual authentication methods, and managed objects used to provide data transfer among autonomously operating stations (STAs) that might not be in direct communication with each other over a single instance of the wireless medium. Communication between STAs using the mesh facility takes place using only the wireless medium. The mesh facility transports an MSDU between source and destination STAs over potentially multiple hops of the wireless medium without transiting the MAC_SAP at intermediate STAs.

**mesh gate:** Any entity that has mesh station (STA) functionality and provides access to one or more distribution systems, via the wireless medium (WM) for the mesh basic service set (MBSS).

**mesh link:** A link from one mesh station (STA) to a neighbor mesh STA that have a mesh peering with each other.

**mesh neighborhood:** The set of all neighbor mesh stations (STAs) relative to a particular mesh STA.

**mesh path:** A concatenated set of mesh links from a source mesh station (STA) to a destination mesh STA.

**mesh path selection:** The process of selecting a mesh path.

**mesh peer service period (MPSP):** A contiguous period of time during which one or more individually addressed frames are transmitted between two peer mesh stations (STAs) with at least one of those mesh STAs operating in light sleep or deep sleep mode. A mesh peer service period is directional and may contain one or more transmission opportunities (TXOPs). A mesh STA may have multiple mesh peer service
periods ongoing in parallel. No more than one mesh peer service period may be set up in each direction with each peer mesh STA.

**mesh peer service period (MPSP) owner:** A mesh station (STA) that obtains transmission opportunities (TXOPs), transmits individually addressed frames to the recipient mesh STA in the mesh peer service period, and terminates the mesh peer service period.

**mesh peering:** A relationship between two mesh stations (STAs) that is required for direct communication over a single instance of the wireless medium (WM). A mesh peering is established with a mesh peering protocol.

**mesh peering management:** A group of protocols to facilitate the mesh peering establishment and closure of the mesh peerings.

**mesh power mode:** The activity level identifier of a mesh station (STA) set per mesh peering or for nonpeer neighbor STAs. A lower activity level enables a mesh STA to reduce its power consumption.

**mesh power mode tracking:** Operation to observe the peering-specific mesh power modes from the peer mesh STAs and to maintain the peering-specific mesh power modes for each peer mesh STA.

**mesh profile:** A set of values of parameters that identifies the attributes of the mesh basic service set (MBSS) and that is used in a single mesh BSS. The mesh profile consists of the identifiers that are the values for the parameters: mesh ID, active path selection protocol, active path selection metric, congestion control mode, synchronization method, and authentication protocol.

**mesh services:** The set of services that enable the creation and operation of a mesh basic service set (MBSS).

**mesh station (STA):** A quality-of-service (QoS) STA that implements the mesh facility.

**message integrity code (MIC):** A value generated by a cryptographic function. If the input data are changed, a new value cannot be correctly computed without knowledge of the cryptographic key(s) used by the cryptographic function.

*NOTE—This is traditionally called a message authentication code (MAC), but the acronym MAC is already reserved for another meaning in this standard.*

**mobile station (STA):** A type of STA that uses network communications while in motion.

**mobility domain:** A set of basic service sets (BSSs), within the same extended service set (ESS), that support fast BSS transitions between themselves and that are identified by the set’s mobility domain identifier (MDID).

**mobility domain identifier (MDID):** An identifier that names a mobility domain.

**multi-level precedence and preemption (MLPP):** A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

**multicast:** See: group addressed.

**multicast address:** See: group address.
multicast-group address: A medium access control (MAC) address associated by higher level convention with a group of logically related stations (STAs).

multiple BSSID capability: The capability to advertise information for multiple basic service set identifiers (BSSIDs) using a single Beacon or Probe Response frame instead of using multiple Beacon or Probe Response frames, each corresponding to a single BSSID, and the capability to indicate buffered frames for these multiple BSSIDs using a single traffic indication map (TIM) element in a single Beacon.

multiple input, multiple output (MIMO): A physical layer (PHY) configuration in which both transmitter and receiver use multiple antennas.

neighbor access point (AP): Any AP that is a potential service set transition candidate.

neighbor station (STA): A STA in the following relationship: STA A is a neighbor to STA B if STA A can both directly transmit to and receive from STA B over the wireless medium.

network access identifier (NAI): The user identity submitted by the Supplicant during IEEE 802.1X authentication.

NOTE—See IETF RFC 4282.

network access server (NAS) client: The client component of a NAS that communicates with the Authentication Server (AS).

network allocation vector (NAV): An indicator, maintained by each station (STA), of time periods when transmission onto the wireless medium (WM) is not initiated by the STA regardless of whether the STA’s clear channel assessment (CCA) function senses that the WM is busy.

next-hop mesh station (STA): The next peer mesh STA on the mesh path to the destination mesh STA.

nonce: A numerical value, used in cryptographic operations associated with a given cryptographic key, that is not to be reused with that key, including over all reinitializations of the system through all time.

non-access-point (non-AP) station (STA): A STA that is not contained within an AP.

nonoperating channel: A channel that is not the operating channel of the basic service set (BSS) of which the station (STA) is a member.

nonpeer mesh power mode: The activity level identifier of a mesh station (STA) towards nonpeer neighbor mesh STAs. Two nonpeer mesh power modes are defined: active mode and deep sleep mode.

non-quality-of-service (non-QoS) access point (AP): An AP that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) basic service set (BSS): A BSS that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) station (STA): A STA that does not support the quality-of-service (QoS) facility.

nontransmitted BSSID: A basic service set identifier (BSSID) corresponding to one of the basic service sets (BSSs) when the multiple BSSID capability is supported, where the BSSID is not announced explicitly but can be derived from the information encoded in the transmitted beacon frames.

15Information on references can be found in Clause 2.
**null data packet (NDP):** A physical layer convergence procedure (PLCP) protocol data unit (PPDU) that carries no Data field.

**off-channel:** Channel that is not the base channel.

**operating channel:** The operating channel is the channel used by the serving AP of the BSS to transmit beacons. In an IBSS the operating channel is the channel used by the IBSS DFS owner to transmit beacons.

**operating channel width:** The channel width in which the station (STA) is currently able to receive.

**overlapping basic service set (OBSS):** A basic service set (BSS) operating on the same channel as the station’s (STA’s) BSS and within (either partly or wholly) its basic service area (BSA).

**over-the-air fast basic service set (BSS) transition (FT):** An FT method in which the station (STA) communicates over a WM link to the target access point (AP).

**over-the-DS (distribution system) fast basic service set (BSS) transition (FT):** An FT method in which the station (STA) communicates with the target access point (AP) via the current AP.

**pairwise:** Referring to, or an attribute of, two entities that are associated with each other, e.g., an access point (AP) and an associated station (STA), or two STAs in an independent basic service set (IBSS) network. This term is used to refer to a type of encryption key hierarchy pertaining to keys shared by only two entities.

**pairwise master key (PMK):** The key derived from a key generated by an Extensible Authentication Protocol (EAP) method or obtained directly from a preshared key (PSK).

**pairwise master key R0 (PMK-R0):** The key at the first level of the fast basic service set (BSS) transition (FT) key hierarchy.

**pairwise master key (PMK) R0 name (PMKR0Name):** An identifier that names the PMK-R0.

**pairwise master key (PMK) R0 key holder identifier (R0KH-ID):** An identifier that names the holder of the PMK-R0 in the Authenticator.

**pairwise master key R1 (PMK-R1):** A key at the second level of the fast basic service set (BSS) transition (FT) key hierarchy.

**pairwise master key (PMK) R1 name (PMKR1Name):** An identifier that names a PMK-R1.

**pairwise master key (PMK) R1 key holder identifier (R1KH-ID):** An identifier that names the holder of a PMK-R1 in the Authenticator.

**pairwise master key (PMK) S0 key holder identifier (S0KH-ID):** An identifier that names the holder of the PMK-R0 in the Supplicant.

**pairwise master key (PMK) S1 key holder identifier (S1KH-ID):** An identifier that names the holder of the PMK-R1 in the Supplicant.

**pairwise transient key (PTK):** A concatenation of session keys derived from the pairwise master key (PMK) or from the PMK-R1. Its components include a key confirmation key (KCK), a key encryption key (KEK), and one or more temporal keys that are used to protect information exchanged over the link.

**pairwise transient key (PTK) name (PTKName):** An identifier that names the PTK.
**parameterized quality of service (QoS):** The treatment of the medium access control (MAC) protocol data units (MPDUs) depends on the parameters associated with the MPDU. Parameterized QoS is primarily provided through the hybrid coordination function (HCF) controlled channel access (HCCA) mechanism, but is also provided by the enhanced distributed channel access (EDCA) mechanism when used with a traffic specification (TSPEC) for admission control.

**pass-phrase:** A secret text string employed to corroborate the user’s identity.

**password:** A shared, secret, and potentially low-entropy word, phrase, code, or key used as a credential for authentication purposes.  
*NOTE*—The method of distribution of a password to the units in the system is outside the scope of this standard.

**path metric:** An aggregate multi-hop criterion used to characterize the performance, quality, and eligibility of a mesh path.

**peer mesh station (STA):** A mesh STA to which a mesh peering has been established.

**peer trigger frame:** A Mesh Data or quality-of-service (QoS) Null frame that initiates a mesh peer service period.

**peer-specific mesh power mode:** The activity level identifier of a mesh station (STA) set per mesh peering. Three peer-specific mesh power modes are defined: active mode, light sleep mode, and deep sleep mode.

**peer-to-peer link:** A direct link within a quality-of-service (QoS) basic service set (BSS), a tunnelled direct-link setup (TDLS) link, or a STA-to-STA communication in an independent basic service set (IBSS).

**PeerKey Handshake:** A key management protocol composed of the station-to-station link (STSL) master key (SMK) Handshake and the 4-Way STSL transient key (STK) Handshake. This is used to create new SMK security associations (SMKSAs) and STK security associations (STKSAs) to secure the STSLs.

**per-frame encryption key:** A unique encryption key constructed for each medium access control (MAC) protocol data unit (MPDU).  
*NOTE*—A per-frame encryption key is employed by some security protocols defined in this standard.

**piggyback:** The overloading of a data frame with an acknowledgment of a previously received medium access control (MAC) protocol data unit (MPDU) and/or a poll to the station (STA) to which the frame is directed.

**point coordinator (PC):** The entity within the STA in an AP that performs the point coordination function.

**point coordination function (PCF):** A class of possible coordination functions in which the coordination function logic is active in only one station (STA) in a basic service set (BSS) at any given time that the network is in operation.

**portable station (STA):** A type of station (STA) that might be moved from location to location, but that only uses network communications while at a fixed location.

**portal:** The logical point at which the integration service is provided.

**precursor mesh station (STA):** A neighbor peer mesh STA on the mesh path to the destination mesh STA, that identifies the mesh STA as the next-hop mesh STA.

**preshared key (PSK):** A static key that is distributed to the units in the system by some out-of-band means.
primary channel: The common channel of operation for all stations (STAs) that are members of the basic service set (BSS).

prioritized quality of service (QoS): The provisioning of service in which the medium access control (MAC) protocol data units (MPDUs) with higher priority are given a preferential treatment over MPDUs with a lower priority. Prioritized QoS is provided through the enhanced distributed channel access (EDCA) mechanism.

protection mechanism: Any procedure that attempts to update the network allocation vector (NAV) of all receiving stations (STAs) prior to the transmission of a frame that might or might not be detected as valid network activity by the PHY entities at those receiving STAs.

protection mechanism frame: Any frame that is sent as part of a protection mechanism procedure.

protocol instance: An execution of a particular protocol that consists of the state of the communicating parties as well as the messages exchanged.

proxy mesh gate: A mesh gate acting as an intermediary for IEEE 802 stations (STAs) outside the mesh basic service set (MBSS).

pseudorandom function (PRF): A function that hashes various inputs to derive a pseudorandom value. In order to ensure liveness of a communication in which a pseudorandom value is used, a nonce is used as one of the inputs to the function.

public safety answering point (PSAP): A physical location where emergency calls are received and routed to the appropriate emergency service dispatch center.
NOTE—See NENA 08-002 [B52].

quadrature binary phase shift keying (QBPSK): A binary phase shift keying modulation in which the binary data is mapped onto the imaginary (Q) axis.

quality-of-service (QoS) access point (AP): An AP that supports the QoS facility. The functions of a QoS AP are a superset of the functions of a non-QoS AP, and thus a QoS AP is able to function as a non-QoS AP to non-QoS stations (STAs).

quality-of-service (QoS) basic service set (BSS): A BSS that provides the QoS facility. An infrastructure QoS BSS contains a QoS access point (AP).

quality-of-service (QoS) facility: The set of enhanced functions, channel access rules, frame formats, frame exchange sequences and managed objects used to provide parameterized and prioritized QoS.

quality-of-service (QoS) independent basic service set (IBSS): An IBSS in which one or more of its stations (STAs) support the QoS facility.

quality-of-service (QoS) station (STA): A STA that implements the QoS facility. A QoS STA acts as a non-QoS STA when associated in a non-QoS basic service set (BSS).

reassociation service: The service that enables an established association [between access point (AP) and station (STA)] to be transferred from one AP to another (or the same) AP.

receive chain: The physical entity that implements any necessary signal processing to provide the received signal to the digital baseband. Such signal processing includes filtering, amplification, down-conversion, and sampling.
receive power: Mean power measured at the antenna connector.

received channel power indicator (RCPI): An indication of the total channel power (signal, noise, and interference) of a received frame measured on the channel and at the antenna connector used to receive the frame.

received power indicator (RPI): A quantized measure of the received power level as seen at the antenna connector.

received signal to noise indicator (RSNI): An indication of the signal to noise plus interference ratio of a received frame. RSNI is defined by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) as measured on the channel and at the antenna connector used to receive the frame.

NOTE—RCPI and ANPI might not be measured simultaneously; see 10.11.9.4 for details.

registered station (STA): A STA for which information needs to be submitted to an appropriate regulatory or coordination authority before it is allowed to transmit.

remote request broker (RRB): The component of the station management entity (SME) of an access point (AP) that supports fast basic service set (BSS) transitions over the distribution system (DS).

resource information container (RIC): A sequence of elements that include resource request and response parameters.

restricted channel: A radio channel in which transmission is restricted to stations (STAs) that operate under the control of licensed operators.

roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

Robust Management frame: A management frame that is eligible for protection.

scheduled service period (SP): The SP that is scheduled by the quality-of-service (QoS) access point (AP). Scheduled SPs start at fixed intervals of time.

service interval (SI): The interval between the start of two successive scheduled service periods (SPs).

service period (SP): A contiguous time during which one or more downlink individually addressed frames are transmitted to a quality-of-service (QoS) station (STA) and/or one or more transmission opportunities (TXOPs) are granted to the same STA. SPs are either scheduled or unscheduled. For a non-access-point (non-AP) STA, there can be at most one SP active at any time.

service set transition: A STA movement from one BSS to another BSS, i.e., either a BSS transition or an ESS transition.

serving AP: The AP to which the STA is associated.

sounding: The use of preamble training fields to measure the channel for purposes other than demodulation of the Data portion of the physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing the training fields.

NOTE—These uses include calculation of transmit steering, calculation of recommended MCS, and calculation of calibration parameters.
source mesh station (STA): A mesh STA from which a MAC service data unit (MSDU) enters the mesh basic service set (MBSS). A source mesh STA may be a mesh STA that is the source of an MSDU or a proxy mesh gate that receives an MSDU from a STA outside of the MBSS and forwards the MSDU on a mesh path.

space-time block coding/spatial multiplexing (STBC/SM): A combination of STBC and SM where one spatial stream is transmitted using STBC and one or two additional spatial streams are transmitted using SM.

space-time streams: Streams of modulation symbols created by applying a combination of spatial and temporal processing to one or more spatial streams of modulation symbols.

spatial multiplexing (SM): A transmission technique in which data streams are transmitted on multiple spatial channels that are provided through the use of multiple antennas at the transmitter and the receiver.

spatial stream: One of several streams of bits or modulation symbols that might be transmitted over multiple spatial dimensions that are created by the use of multiple antennas at both ends of a communications link.

station (STA): A logical entity that is a singly addressable instance of a medium access control (MAC) and physical layer (PHY) interface to the wireless medium (WM).

station service (SS): The set of services that support transport of medium access control (MAC) service data units (MSDUs) between stations (STAs) within a basic service set (BSS).

subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

Supplicant: An entity at one end of a point-to-point LAN segment that is being authenticated by an Authenticator attached to the other end of that link. (IEEE Std 802.1X-2004)

Supplicant address (SPA): The medium access control (MAC) address of the IEEE 802.1X Supplicant.

temporal encryption key: The portion of a pairwise transient key (PTK) or group temporal key (GTK) used directly or indirectly to encrypt data in medium access control (MAC) protocol data units (MPDUs).

temporal key (TK): The combination of temporal encryption key and temporal message integrity code (MIC) key.

temporal message integrity code (MIC) key: The portion of a transient key used to ensure the integrity of medium access control (MAC) service data units (MSDUs) or MAC protocol data units (MPDUs).

time unit (TU): A measurement of time equal to 1024 µs.

traffic category (TC): A label for medium access control (MAC) service data units (MSDUs) that have a distinct user priority (UP), as viewed by higher layer entities, relative to other MSDUs provided for delivery over the same link. Traffic categories are meaningful only to MAC entities that support quality of service (QoS) within the MAC data service. These MAC entities determine the UP for MSDUs belonging to a particular traffic category using the priority value provided with those MSDUs at the MAC service access point (MAC_SAP).
traffic classification (TCLAS): The specification of certain parameter values to identify the medium access control (MAC) service data units (MSDUs) belonging to a particular traffic stream (TS). The classification process, performed above the MAC service access point (MAC_SAP) at a quality-of-service (QoS) access point (AP), uses the parameter values for a given TS to examine each incoming MSDU and determine whether this MSDU belongs to that TS. TCLAS might also occur at non-access-point (non-AP) QoS station (STA) with multiple streams.

NOTE—However, such classification is beyond the scope of this standard.

traffic filter: A set of traffic specifications defined by the use of traffic classification (TCLAS) elements that are utilized by the traffic filtering service (TFS) to identify specific allowed frames.

traffic filtering service (TFS): A service provided by an access point (AP) to a non-AP station (STA) to reduce the number of frames sent to the non-AP STA by not forwarding individually addressed frames addressed to the non-AP STA that do not match traffic filters specified by the non-AP STA.

traffic identifier (TID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities that support quality of service (QoS) within the MAC data service. There are 16 possible TID values; eight identify TCs, and the other eight identify parameterized TSs. The TID is assigned to an MSDU in the layers above the MAC.

traffic indication map (TIM) broadcast: A service that enables a non-access-point (non-AP) station (STA) to request periodic transmission of a TIM frame by the AP. TIM frames have shorter duration than Beacon frames and can be transmitted at a higher physical layer (PHY) rate, which allows the STA to save additional power while periodically checking for buffered traffic in standby mode, relative to the power consumed if the station (STA) were to periodically wake up to receive a beacon frame.

traffic specification (TSPEC): The quality-of-service (QoS) characteristics of a data flow to and from a QoS station (STA).

traffic stream (TS): A set of medium access control (MAC) service data units (MSDUs) to be delivered subject to the quality-of-service (QoS) parameter values provided to the MAC in a particular traffic specification (TSPEC). TSs are meaningful only to MAC entities that support QoS within the MAC data service. These MAC entities determine the TSPEC applicable for delivery of MSDUs belonging to a particular TS using the priority parameter provided with those MSDUs at the MAC service access point (MAC_SAP).

traffic stream identifier (TSID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities for parameterized quality of service (QoS) [i.e., the traffic stream (TS) with a particular traffic specification (TSPEC)] within the MAC data service. The TSID is assigned to an MSDU in the layers above the MAC.

transmission opportunity (TXOP): An interval of time when a particular quality-of-service (QoS) station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM). A TXOP is defined by a starting time and a maximum duration. The TXOP is either obtained by the STA by successfully contending for the channel or assigned by the hybrid coordinator (HC).

transmission opportunity (TXOP) holder: A quality-of-service (QoS) station (STA) that has either been granted a TXOP by the hybrid coordinator (HC) or successfully contended for a TXOP.

transmission opportunity (TXOP) responder: A station (STA) that transmits a frame in response to a frame received from a TXOP holder during a frame exchange sequence, but that does not acquire a TXOP in the process.
transmitted basic service set identifier (BSSID): The BSSID included in the MAC Header transmitter address field of a Beacon frame when the multiple BSSID capability is supported.

tunneled direct-link setup (TDLS): A protocol that uses a specific Ethertype encapsulation to TDLS frames through an access point (AP) to establish a TDLS direct link.

tunneled direct-link setup (TDLS) direct link: Direct link between two non-AP stations (STAs) that has been established using the TDLS protocol.

tunneled direct-link setup (TDLS) initiator station (STA): A STA that transmits a TDLS Setup Request frame or a TDLS Discovery Request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM): A power save mode that is based on periodically scheduled service periods, which can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer power save mode (PSM) initiator: A station (STA) that transmits a TDLS Peer PSM request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM) responder: A station (STA) that transmits a TDLS Peer PSM response frame.

tunneled direct-link setup (TDLS) peer station (STA): A STA with a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)]: A power save mode based on unscheduled service periods that can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] buffer station (STA): A TDLS peer STA that buffers traffic for a TPU sleep STA.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] sleep station (STA): A TDLS STA that entered power save mode on a TDLS direct link and that is using TPU for the delivery of buffered traffic.

tunneled direct-link setup (TDLS) power save mode (PSM): TDLS peer PSM or peer unscheduled automatic power save delivery (U-APSD).

tunneled direct-link setup (TDLS) responder station (STA): A STA that receives or is the intended recipient of a TDLS Setup Request frame or TDLS Discovery Request frame.

unauthorized disclosure: The process of making information available to unauthorized individuals, entities, or processes.

unauthorized resource use: Use of a resource not consistent with the defined security policy.

unicast: See: individually addressed.

unicast address: See: individual address.

uniform spreading: A regulatory requirement for a channel selection mechanism that provides uniform usage across a minimum set of channels in the regulatory domain.
unreachable destination: A destination mesh station (STA) for which the link to the next hop of the mesh path to this destination mesh STA is no longer usable.

unreachable star: A star that cannot be reached. Often associated with impossible dreams.

unscheduled service period (SP): The period that is started when a quality-of-service (QoS) station (STA) transmits a trigger frame to the QoS access point (AP).

uplink: A unidirectional link from a non-access-point (non-AP) station (STA) to an access point (AP).

user priority (UP): A value associated with an medium access control (MAC) service data unit (MSDU) that indicates how the MSDU is to be handled. The UP is assigned to an MSDU in the layers above the MAC.

validated AP: An AP that has either been explicitly configured as a Neighbor or learned through a mechanism like the Beacon Report.

wildcard BSSID: A BSSID value (all binary 1s) used to represent all BSSIDs.

wildcard SSID: A SSID value (null) used to represent all SSIDs.

wireless distribution system (WDS): Often used as a vernacular term for a mechanism for wireless communication among nonmesh stations (STAs) using a four address frame format.

NOTE—This standard specifies such a frame format and its use only for a mesh basic service set (MBSS). Because of this, the term WDS is obsolete and subject to removal in a subsequent revision of this standard.

wireless local area network (WLAN) system: A system that includes the distribution system (DS), access points (APs), and portal entities. It is also the logical location of distribution and integration service functions of an extended service set (ESS). A WLAN system contains one or more APs and zero or more portals in addition to the DS.

wireless medium (WM): The medium used to implement the transfer of protocol data units (PDUs) between peer physical layer (PHY) entities of a wireless local area network (LAN).

3.2 Definitions specific to IEEE 802.11

The following terms and definitions are specific to terms or references in this standard and are not appropriate for inclusion in the IEEE Standards Dictionary: Glossary of Terms & Definitions.

20 MHz basic service set (BSS): A BSS in which the Secondary Channel Offset field is equal to SCN.

20 MHz high-throughput (HT): A Clause 20 transmission using FORMAT=HT_MF or HT_GF and CH_BANDWIDTH=HT_CBW20.

20 MHz mask physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 18 PPDU, a Clause 19 orthogonal frequency division multiplexing (OFDM) PPDU, or a Clause 20 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20. The PPDU is transmitted using a 20 MHz transmit spectral mask defined in Clause 18, Clause 19, or Clause 20, respectively.

20 MHz physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 16 PPDU, Clause 18 PPDU, Clause 17 PPDU, Clause 19 orthogonal frequency division multiplexing (OFDM) PPDU, or Clause 20 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH
equal to HT_CBW20.

**20/40 MHz basic service set (BSS):** A BSS in which the supported channel width of the access point (AP) or dynamic frequency selection (DFS) owner (DO) station (STA) is 20 MHz and 40 MHz (Channel Width field is equal to 1) and the Secondary Channel Offset field is equal to a value of SCA or SCB.

**40-MHz-capable (FC) high-throughput (HT) access point (AP):** An HT AP that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

**40-MHz-capable (FC) high-throughput (HT) access point (AP) 2G4:** An HT AP 2G4 that is also an FC HT AP.

**40-MHz-capable (FC) high-throughput (HT) access point (AP) 5G:** An HT AP 5G that is also an FC HT AP.

**40-MHz-capable (FC) high-throughput (HT) station (STA):** An HT STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

**40-MHz-capable (FC) high-throughput (HT) station (STA) 2G4:** An HT STA 2G4 that is also an FC HT STA.

**40-MHz-capable (FC) high-throughput (HT) station (STA) 5G:** An HT STA 5G that is also an FC HT STA.

**40 MHz high throughput (HT):** A Clause 20 transmission using FORMAT=HT_MF or HT_GF and CH_BANDWIDTH=HT_CBW40.

**40 MHz physical layer convergence procedure (PLCP) protocol data unit (PPDU):** One of the following PPDUs: 1) a 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40); 2) a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40); or 3) a Clause 20 20 MHz HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to either CH_OFF_20U or CH_OFF_20L. The PPDU is transmitted using a 40 MHz transmit spectral mask defined in Clause 20.

**40 MHz physical layer convergence procedure (PLCP) protocol data unit (PPDU):** A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) or a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40) as defined in Clause 20.

**4-Way Handshake:** A pairwise key management protocol defined by this standard. This handshake confirms mutual possession of a pairwise master key (PMK) by two parties and distributes a group temporal key (GTK).

**4-Way station-to-station link (STSL) transient key (STK) Handshake:** A key management protocol between two parties that confirms mutual possession of an STSL master key (SMK) and distributes an STK.

**Access Network Query Protocol (ANQP):** The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

**advertisement protocol:** Access Network Query Protocol (ANQP) and higher layer protocols defined external to this standard that are used for network and service discovery.
advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this specification.

basic space-time block coding (STBC) modulation and coding scheme (MCS): An MCS value and STBC encoder specification used in the transmission of STBC-encoded control frames and STBC-encoded group addressed frames. The value is defined in 9.7.3.

BSSBasicMCSSet: The set of modulation and coding scheme (MCS) values that are supported by all high-throughput (HT) stations (STAs) that are members of an HT basic service set (BSS).

bufferable management frame: Either an individually addressed Probe Response frame that is sent in an IBSS in response to an individually addressed Probe Request frame, or an Action, Disassociation, or Deauthentication frame.

bufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is transmitted using one or more bufferable management frames.

bufferable unit (BU): An MSDU, A-MSDU (HT STAs only) or bufferable MMPDU that is buffered to operate the power saving protocol.

delivery traffic indication message (DTIM) interval: The interval between the consecutive TBTTs of beacons containing a DTIM. The value, expressed in time units, is equal to the product of the value in the Beacon Interval field and the value in the DTIM Period subfield in the TIM element in Beacon frames.

direct sequence spread spectrum orthogonal frequency division multiplexing (DSSS-OFDM): A PHY using DSSS-OFDM modulation under 19.7 rules.

direct sequence spread spectrum/complementary code keying (DSSS/CCK): A Clause 16 or Clause 17 transmission.

dynamic frequency selection (DFS) owner (DO) station (STA): A STA that is the DFS Owner of an IBSS or off-channel tunneled direct-link setup (TDLS) direct link that is operating on a channel within an operating class that has a value of 20 or 40 for the entry in the “Channel spacing” column and that has a value of 5 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

EAPOL-Key confirmation key (KCK): A key used to integrity-check an EAPOL-Key frame.

EAPOL-Key encryption key (KEK): A key used to encrypt the Key Data field in an EAPOL-Key frame.

emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

extended channel switching (ECS): A procedure that is used to announce a pending change of operating channel, operating class, or both.

extended rate PHY (ERP): A PHY conforming to Clause 19

extended rate PHY using CCK modulation (ERP-CCK): A PHY operating under Clause 19 rules.

extended rate PHY using DSSS modulation (ERP-DSSS): A PHY operating under Clause 19 rules.
extended rate PHY using DSSS or CCK modulation (ERP-DSSS/CCK): A PHY operating under Clause 19 rules.

extended rate PHY using OFDM modulation (ERP-OFDM): A PHY operating under 19.5 rules.

extended rate PHY using extended rate PBCC modulation (ERP-PBCC): A PHY operating under 19.6 rules.

extended service set (ESS) link: In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non-access-point (non-AP) station (STA) and one of the APs that is a member of the ESS.

fast BSS transition (FT) originator: A STA that initiates the FT protocol by sending an FT Request frame or an Authentication frame with Authentication Algorithm equal to Fast BSS Transition.

IEEE 802.11 station (STA): Any station that is conformant to IEEE 802.11. Any reference to the term station (STA) in this standard where not qualified by the term IEEE 802.11 implicitly refers to an IEEE 802.11 station.

generic advertisement service (GAS): An over-the-air transportation service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non-access-point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

group addressed bufferable unit (BU): A group addressed MSDU or group addressed bufferable MMPDU.

group temporal key security association (GTKSA): The context resulting from a successful group temporal key (GTK) distribution exchange via either a Group Key Handshake or a 4-Way Handshake.

high-throughput (HT) basic service set (BSS): A BSS in which Beacon frames transmitted by an HT station (STA) include the HT Capabilities element.

high-throughput-delayed (HT-delayed) block acknowledgment (Ack): A Delayed Block Ack mechanism that requires the use of the compressed BlockAck frame and the No Acknowledgement ack policy setting within both BlockAckReq and BlockAck frames. This Block Ack scheme is negotiated between two HT stations (STAs) that both support HT Delayed Block Ack.

high-throughput-immediate (HT-immediate) block acknowledgment (Ack): An Immediate Block Ack mechanism that requires the use of the compressed BlockAck frame and an implicit Block Ack request and allows partial-state operation at the recipient. This Block Ack scheme is negotiated between two HT stations (STAs).

high-throughput-greenfield (HT-greenfield) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the HT physical layer (PHY) using the HT-greenfield format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_GF.

high-throughput-mixed (HT-mixed) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the HT physical layer (PHY) using the HT-mixed format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_MF.
high-throughput (HT) physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 20 PPDU with the TXVECTOR FORMAT parameter equal to HT_MF or HT_GF.

high-throughput (HT) station (STA) 2G4: An HT STA that is also a STA 2G4.

high-throughput (HT) station (STA) 5G: An HT STA that is also a STA 5G.

individually addressed bufferable unit (BU): An individually addressed MSDU, individually addressed A-MSDU (HT STAs only) or individually addressed bufferable MMPDU.

interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE 802.11 networks. Functions of the interworking service assist non-access-point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality-of-service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

key counter: A 256-bit (32-octet) counter that is used in the pseudorandom function (PRF) to generate initialization vectors (IVs). There is a single key counter per station (STA) that is global to that STA.

key data encapsulation (KDE): Format for data other than elements in the EAPOL-Key Data field.

key management service: A service to distribute and manage cryptographic keys within a robust security network (RSN).

mesh awake window: A period of time during which the mesh station (STA) operates in awake state after its Beacon or Probe Response frame transmission that contained the Mesh Awake Window element.

mesh coordination function (MCF): A coordination function that combines aspects of the contention-based and scheduled access methods. The MCF includes the functionality provided by both enhanced distributed channel access (EDCA) and MCF controlled channel access (MCCA).

mesh coordination function (MCF) controlled channel access (MCCA): A coordination function for the mesh basic service set (MBSS).

mesh coordination function (MCF) controlled channel access opportunity (MCCAOP): A period of time scheduled for frame transmissions between mesh stations (STAs) using MCF controlled channel access (MCCA).

Mesh Data frame: An individually addressed Data frame with both the From DS and To DS bits set to 1 and that is transmitted from a mesh station (STA) to a peer mesh STA, or a group addressed Data frame that has From DS set to 1 and To DS set to 0 that is transmitted by a mesh STA.

Michael: The message integrity code (MIC) for the Temporal Key Integrity Protocol (TKIP).

minimum downlink transmission time (DTT) to uplink transmission time (UTT) [DTT2UTT] spacing: The minimum time within a power save multi-poll (PSMP) sequence between the end of a station’s (STA’s) PSMP-DTT and the start of its PSMP-UTT.

modulation and coding scheme (MCS): A specification of the high-throughput (HT) physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM) and forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6).

modulation and coding scheme 32 (MCS 32) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the high-throughput (HT) physical layer (PHY) in which signals in two
halves of the occupied channel width contain the same information. This HT PPDU format supports the lowest rate.

**modulation and coding scheme (MCS) feedback (MFB) requester:** A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing an HT Control field in which the modulation and coding scheme (MCS) request (MRQ) subfield is equal to 1.

**modulation and coding scheme (MCS) feedback (MFB) responder:** A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing an HT Control field with the MFB field containing an MCS index or the value 127 in response to a PPDU containing an HT Control field in which the modulation and coding scheme (MCS) request (MRQ) subfield is equal to 1.

**multiple basic service set identifier (BSSID) set:** A collection of cooperating APs, such that all the APs use a common operating class, channel, and antenna connector.

**non-40-MHz-capable (non-FC) high-throughput (HT) station (STA):** A STA that is not an FC HT STA.

**nonaggregate medium access control (MAC) protocol data unit (non-A-MPDU) frame:** A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) with the TXVECTOR AGGREGATION parameter either absent or equal to NOT_AGGREGATED.

**nonbufferable medium access control (MAC) management protocol data unit (MMPDU):** An MMPDU that is not a bufferable MMPDU.

**nonextended rate PHY (NonERP):** A PHY conforming to Clause 16 or Clause 17, but not to Clause 19.

**non-high-throughput (non-HT) duplicate:** A transmission format of the physical layer (PHY) that duplicates a 20 MHz non-HT transmission in two adjacent 20 MHz channels and allows a station (STA) in a non-HT basic service set (BSS) on either channel to receive the transmission.

**non-high-throughput (non-HT) duplicate frame:** A frame transmitted in a non-HT duplicate physical layer convergence procedure (PLCP) protocol data unit (PPDU).

**non-high-throughput (non-HT) duplicate physical layer convergence procedure (PLCP) protocol data unit (PPDU):** A PPDU transmitted by a Clause 20 physical layer (PHY) with the TXVECTOR FORMAT parameter equal to NON_HT and the CH_BANDWIDTH parameter equal to NON_HT_CBW40.

**non-high-throughput (non-HT) physical layer convergence procedure (PLCP) protocol data unit (PPDU):** A Clause 20 physical layer (PHY) PPDU with the TXVECTOR FORMAT parameter equal to NON_HT.

**Non-High-Throughput (non-HT) SIGNAL field (L-SIG) transmit opportunity (TXOP) protection:** A protection mechanism in which protection is established by the non-HT SIG Length and Rate fields indicating a duration that is longer than the duration of the PPDU itself.

**non-phased-coexistence-operation-capable (non-PCO-capable) 20/40 station (STA):** A high-throughput (HT) STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element and that sets the PCO field in the HT Extended Capabilities field to 0.

**non-space-time-block-coding (non-STBC) frame:** A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that has the TXVECTOR STBC parameter equal to 0, or a frame that is received in a PPDU that has the RXVECTOR STBC parameter equal to 0.
null data packet (NDP) announcement: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) that contains one or more +HTC frames (i.e., frames with an HT (high-throughput) Control field) that have the NDP Announcement subfield equal to 1.

operating class: An E.1 index into a set of values for radio operation in a regulatory domain.

pairwise master key (PMK) R0 key holder (R0KH): The component of robust security network association (RSNA) key management of the Authenticator that is authorized to derive and hold the PMK-R0, derive the PMK-R1s, and distribute the PMK-R1s to the R1KHs.

pairwise master key (PMK) R1 key holder (R1KH): The component of robust security network association (RSNA) key management of the Authenticator that receives a PMK-R1 from the R0KH, holds the PMK-R1, and derives the PTKs.

pairwise master key (PMK) S0 key holder (S0KH): The component of robust security network association (RSNA) key management of the Supplicant that derives and holds the PMK-R0, derives the PMK-R1s, and provides the PMK-R1s to the S1KH.

pairwise master key (PMK) S1 key holder (S1KH): The component of robust security network association (RSNA) key management in the Supplicant that receives a PMK-R1 from the S0KH, holds the PMK-R1, and derives the PTKs.

pairwise master key security association (PMKSA): The context resulting from a successful IEEE 802.1X authentication exchange between the peer and Authentication Server (AS) or from a preshared key (PSK).

pairwise transient key security association (PTKSA): The context resulting from a successful 4-Way Handshake exchange between the peer and Authenticator.

payload protected (PP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with CTR with CBC-MAC Protocol (CCMP) but does not include the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

per-frame sequence counter: For Temporal Key Integrity Protocol (TKIP), the counter that is used as the nonce in the derivation of the per-frame encryption key. For Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP), the per-frame initialization vector (IV).

phased coexistence operation (PCO): A basic service set (BSS) mode with alternating 20 MHz and 40 MHz phases controlled by an access point (AP).

phased coexistence operation (PCO) active access point (AP): A high-throughput (HT) AP that is operating PCO.

phased coexistence operation (PCO) active basic service set (BSS): A BSS in which a PCO active access point (AP) has the PCO Active field in the HT Operation element equal to 1.

phased coexistence operation (PCO) active non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that is associated with a PCO basic service set (BSS) and following PCO.

phased coexistence operation (PCO) active station (STA): A STA that is either a PCO active access point (AP) or a PCO active non-AP STA.

phased-coexistence-operation-capable (PCO-capable) access point (AP): A high-throughput (HT) AP that sets the PCO field in the HT Extended Capabilities field to 1.
phased-coexistence-operation-capable (PCO-capable) non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that sets the PCO field in the HT Extended Capabilities field to 1.

phased-coexistence-operation-capable (PCO-capable) station (STA): A STA that is either a PCO capable access point (AP) or a PCO capable non-AP STA.

phased coexistence operation (PCO) inactive basic service set (BSS): A 20/40 MHz BSS in which an access point (AP) has the PCO Active field in the HT Operation element equal to 0.

power save multi-poll (PSMP): A mechanism that provides a time schedule that is used by an access point (AP) and its stations (STAs) to access the wireless medium. The mechanism is controlled using the PSMP frame.

power save multi-poll (PSMP) burst: A series of one or more PSMP sequences, separated by short interframe space (SIFS).

power save multi-poll downlink transmission time (PSMP-DTT): A period of time described by a PSMP frame during which the access point (AP) transmits.

power save multi-poll (PSMP) sequence: A sequence of frames where the first frame is a PSMP frame that is followed by transmissions in zero or more power save multi-poll downlink transmission times (PSMP-DTTs) and then by transmissions in zero or more power save multi-poll uplink transmission times (PSMP-UTTs). The schedule of the PSMP-DTTs and PSMP-UTTs is defined in the PSMP frame.

power save multi-poll (PSMP) session: The periodic generation of a PSMP burst aligned to its service period (SP).

power save multi-poll uplink transmission time (PSMP-UTT): A period of time described by a PSMP frame during which a non-access-point (non-AP) station (STA) can transmit.

power save multi-poll uplink transmission time (PSMP-UTT) spacing (PUS): The period of time between the end of one PSMP-UTT and the start of the following PSMP-UTT within the same PSMP sequence.

pre-robust security network association (pre-RSNA): The type of association used by a pair of stations (STAs) if the procedure for establishing authentication or association between them did not include the 4-Way Handshake.

pre-robust security network association (pre-RSNA) equipment: A device that is not able to create robust security network associations (RSNAs).

Protected Dual of Public Action frame: An Action frame with the category value specified in 8.4.1.11 Table 8-38. For each Protected Dual of Public Action frame, there is a dual Action frame in a category that is specified with “No” in the “Robust” column of Table 8-38.

quality-of-service (QoS) frame: A frame containing the QoS control field.

reverse direction (RD) initiator: A station (STA) that is a transmit opportunity (TXOP) holder that transmits a medium access control (MAC) protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

reverse direction (RD) responder: A station (STA) that is not the RD initiator and whose medium access control (MAC) address matches the value of the Address 1 field of a received MAC protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.
Robust Action frame: An Action frame with a category value specified in 8.4.1.11 Table 8-38 with “Yes” in the “Robust” column.

robust security network (RSN): A security network that allows only the creation of robust security network associations (RSNAs). An RSN can be identified by the indication in the RSN element (RSNE) of Beacon frames that the group cipher suite specified is not wired equivalent privacy (WEP).

robust security network association (RSNA): The type of association used by a pair of stations (STAs) if the procedure to establish authentication or association between them includes the 4-Way Handshake. Note that existence of an RSNA between two STAs does not of itself provide robust security. Robust security is provided when all STAs in the network use RSNAs.

robust-security-network-association- (RSNA-) capable equipment: A device that contains a station (STA) that is able to create RSNAs. Such a device might use pre-RSNAs because of configuration. Notice that RSNA-capable does not imply full compliance with the RSNA Protocol Implementation Conformance Statement (PICS). A legacy device that has been upgraded to support Temporal Key Integrity Protocol (TKIP) might be RSNA-capable, but is not compliant with the PICS if it does not also support Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP).

robust-security-network-association- (RSNA-) enabled equipment: A station (STA) when it is RSNA-capable and dot11RSNAActivated is true.

robust security network association (RSNA) key management: Key management that includes the 4-Way Handshake, the Group Key Handshake, and the PeerKey Handshake. If fast basic service set (BSS) transition (FT) is enabled, the FT 4-Way Handshake and FT authentication sequence are also included.

secondary channel: A 20 MHz channel associated with a primary channel used by high-throughput (HT) stations (STAs) for the purpose of creating a 40 MHz channel.

security network: A basic service set (BSS) where the station (STA) starting the BSS provides information about the security capabilities and configuration of the BSS by including the robust security network element (RSNE) in Beacon frames.

Self-protected Action frame: An Action frame that is not eligible for protection by the Robust Management frame service. The protection on each Self-protected Action frame is provided by the protocol that uses the frame.

signaling and payload protected (SPP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with CTR with Cipher-block chaining Protocol (CCMP) and that includes the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

sounding physical layer convergence procedure (PLCP) protocol data unit (PPDU): A PPDU that is intended by the transmitting station (STA) to enable the receiving STA to estimate the channel between the transmitting STA and the receiving STA. The Not Sounding field in the High-Throughput SIGNAL field (HT-SIG) is equal to 0 in sounding PPDUs.

space-time block coding (STBC) beacon: A beacon that is transmitted using the basic STBC modulation and coding scheme (MCS) to enable discovery of the basic service set (BSS) by high-throughput (HT) stations (STAs) that support the HT STBC feature in order to extend the range of the BSS.

space-time block coding (STBC) delivery traffic indication map (DTIM): An STBC beacon transmission that is a DTIM beacon.
space-time block coding (STBC) frame: A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that has a nonzero value of the TXVECTOR STBC parameter, or a frame that is received in a PPDU that has a nonzero value of the RXVECTOR STBC parameter.

staggered preamble: A physical layer convergence procedure (PLCP) preamble in a sounding PLCP protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

staggered sounding: The use of a sounding physical layer convergence procedure (PLCP) protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

station (STA) 2G4: A STA that is operating on a channel that belongs to any operating class that has a value of 25 or 40 for the entry in the “Channel spacing” column and that has a value of 2.407 or 2.414 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station (STA) 5G: A STA that is operating on a channel that belongs to any operating class that has a value of 20 or 40 for the entry in the “Channel spacing” column and that has a value of 5 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station-to-station link (STSL): A direct link established between two stations (STAs) while associated to a common access point (AP). This term refers to a generic mechanism that allows direct station-to-station communication while remaining in the infrastructure mode. Establishment of this type of link includes an initialization step. The STSL is terminated by specific teardown procedures under the conditions prescribed in this standard. The only example of this procedure currently specified is direct link established by the direct-link setup (DLS).

station-to-station link (STSL) master key (SMK): A random value generated by an access point (AP) during an SMK Handshake. It is used for deriving an STSL transient key (STK).

station-to-station link (STSL) master key (SMK) Handshake: A key management protocol between two parties that creates a new SMK.

station-to-station link (STSL) master key security association (SMKSA): The context resulting from a successful STSL master key (SMK) Handshake.

station-to-station link (STSL) transient key (STK): A value that is derived from the STSL master key (SMK), initiator MAC address (MAC_I), peer MAC address (MAC_P), initiator nonce (INonce), and peer nonce (PNonce), using the pseudorandom function (PRF). The value is split into as many as five keys, i.e., temporal encryption key, two temporal message integrity code (MIC) keys, EAPOL-Key encryption key (KEK), and EAPOL-Key confirmation key (KCK).

station-to-station link (STSL) transient key security association (STKSA): The context resulting from a successful 4-Way STSL transient key (STK) exchange.

subscription service provider (SSP) roaming: The act when a station (STA) uses an SSP’s IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA’s own SSP.

time priority management frame: a management frame that is transmitted using specific frame type channel access rules.

transition security network (TSN): A security network that allows the creation of pre-robust security network associations (pre-RSNAs) as well as RSNAs. A TSN is identified by the indication in the robust
security network element (RSNE) of Beacon frames that the group cipher suite in use is wired equivalent privacy (WEP).

transmit power: The effective isotropic radiated power (EIRP) when referring to the operation of an orthogonal frequency division multiplexing (OFDM) physical layer (PHY) in a country where so regulated.

trigger-enabled access category (AC): A quality-of-service (QoS) station (STA) AC where frames of subtype QoS Data and QoS Null from the STA that map to the AC trigger an unscheduled service period (SP) if one is not in progress.

wired equivalent privacy (WEP): A deprecated cryptographic data confidentiality algorithm specified by this standard.

wireless-network-management-sleep (WNM-sleep) mode: An extended power save mode for non-access-point (non-AP) stations (STAs) whereby a non-AP STA need not listen for every delivery traffic indication map (DTIM) Beacon frame and does not perform group temporal key/integrity group temporal key (GTK/IGTK) updates.

4. General description

4.1 General description of the architecture

This clause presents the concepts and terminology used within this standard. Specific terms are defined in Clause 3. Illustrations convey key IEEE 802.11 concepts and the interrelationships of the architectural components. IEEE Std 802.11 uses an architecture to describe functional components of an IEEE 802.11 LAN. The architectural descriptions are not intended to represent any specific physical implementation of IEEE Std 802.11.

4.2 How WLAN systems are different

4.2.1 Introduction

Wireless networks have fundamental characteristics that make them significantly different from traditional wired LANs.

4.2.2 Wireless station (STA)

In the design of wired LANs it is implicitly assumed that an address is equivalent to a physical location. In wireless networks, this is not always the case. In IEEE Std 802.11, the addressable unit is a station (STA). The term implies no more than the origin or/and destination of a message. Physical and operational characteristics are defined by modifiers that are placed in front of the term STA. For example, in the case of location and mobility, the addressable units are the fixed STA, the portable STA, and the mobile STA. The STA is a message destination, but not (in general) a fixed location.

A STA might take on multiple distinct characteristics, each of which shape its function. For example, a single addressable unit might simultaneously be a portable STA, a quality-of-service (QoS) STA, a dependent STA, and a hidden STA.

4.2.3 Media impact on design and performance

The PHYs used in IEEE Std 802.11 are fundamentally different from wired media. Thus IEEE 802.11 PHYs:

a) Use a medium that has neither absolute nor readily observable boundaries outside of which STAs with conformant PHY transceivers are known to be unable to receive network frames
b) Are unprotected from other signals that are sharing the medium
c) Communicate over a medium significantly less reliable than wired PHYs
d) Have dynamic topologies
e) Lack full connectivity, and therefore the assumption normally made that every STA can hear every other STA is invalid (i.e., STAs might be “hidden” from each other)
f) Have time-varying and asymmetric propagation properties
g) Might experience interference from logically disjoint IEEE 802.11 networks operating in overlapping areas

Because of limitations on wireless PHY ranges, WLANs intended to cover reasonable geographic distances may be built from basic coverage building blocks. When providing QoS services, the MAC endeavors to provide QoS “service guarantees” within the limitations of the medium properties identified above. In other words, particularly in unlicensed spectrum, true guarantees are often not possible. However, gradations of service are always possible; and in sufficiently controlled environments, QoS guarantees are possible.
4.2.4 The impact of handling mobile STAs

One of the requirements of IEEE Std 802.11 is to handle mobile as well as portable STAs. A portable STA is one that is moved from location to location, but that is only used while at a fixed location. Mobile STAs actually access the LAN while in motion.

For technical reasons, it is not sufficient to handle only portable STAs. Propagation effects blur the distinction between portable and mobile STAs; stationary STAs often appear to be mobile due to propagation effects.

Another aspect of mobile STAs is that they may often be battery powered. Hence power management is an important consideration. For example, it cannot be presumed that a STA’s receiver is always powered on.

4.2.5 Interaction with other IEEE 802® layers

IEEE Std 802.11 is required to appear to higher layers [logical link control (LLC)] as a wired IEEE 802 LAN. This requires that the IEEE 802.11 network handle STA mobility within the MAC sublayer. To meet reliability assumptions (that LLC makes about lower layers), it is necessary for IEEE Std 802.11 to incorporate functionality that is untraditional for MAC sublayers.

In a robust security network association (RSNA), IEEE Std 802.11 provides functions to protect data frames, IEEE Std 802.1X-2004 provides authentication and a Controlled Port, and IEEE Std 802.11 and IEEE Std 802.1X-2004 collaborate to provide key management. All STAs in an RSNA have a corresponding IEEE 802.1X entity that handles these services. This standard defines how an RSNA utilizes IEEE Std 802.1X-2004 to access these services.

When used to support applications with QoS requirements, each IEEE 802.11 LAN provides a link within an end-to-end QoS environment that may be established between, and managed by, higher layer entities. To handle QoS traffic in a manner comparable to other IEEE 802 LANs, the IEEE 802.11 QoS facility requires the IEEE 802.11 MAC sublayers to incorporate functionality that is not traditional for MAC sublayers. In addition, it may be necessary for certain higher layer management entities to be “WLAN aware” at least to the extent of understanding that the available bandwidth and other QoS characteristics of a WLAN are subject to frequent, and sometimes substantial, dynamic changes due to causes other than traffic load and are outside the direct control of network management entities.

4.2.6 Interaction with non-IEEE-802 protocols

An RSNA utilizes non-IEEE-802 protocols for its authentication and key management (AKM) services. Some of these protocols are defined by other standards organizations, such as the Internet Engineering Task Force (IETF).

4.3 Components of the IEEE 802.11 architecture

4.3.1 General

The IEEE 802.11 architecture consists of several components that interact to provide a WLAN that supports STA mobility transparently to upper layers.

The basic service set (BSS) is the basic building block of an IEEE 802.11 LAN. Figure 4-1 shows two BSSs, each of which has two STAs that are members of the BSS.

It is useful to think of the ovals used to depict a BSS as the coverage area within which the member STAs of the BSS may remain in communication. (The concept of area, while not precise, is often good enough.) This
area is called the Basic Service Area (BSA). If a STA moves out of its BSA, it can no longer directly communicate with other STAs present in the BSA.

![Figure 4-1—BSSs](image)

4.3.2 The independent BSS (IBSS) as an ad hoc network

The IBSS is the most basic type of IEEE 802.11 LAN. A minimum IEEE 802.11 LAN may consist of only two STAs. Since the BSSs shown in Figure 4-1 are simple and lack other components (contrast this with Figure 4-2), the two can be taken to be representative of two IBSSs.

This mode of operation is possible when IEEE 802.11 STAs are able to communicate directly. Because this type of IEEE 802.11 LAN is often formed without preplanning, for only as long as the LAN is needed, this type of operation is often referred to as an **ad hoc network**.

4.3.3 STA membership in a BSS is dynamic

A STA’s membership in a BSS is dynamic (STAs turn on, turn off, come within range, and go out of range). To become a member of an infrastructure BSS or an IBSS, a STA joins the BSS using the synchronization procedure described in 10.1.4.5. To start a new mesh BSS or to become a member of a mesh BSS, a STA starts the transmission of Beacons and performs the synchronization maintenance procedure described in 13.13. To access all the services of an infrastructure BSS, a STA becomes “associated.” These associations are dynamic and involve the use of the distribution system service (DSS), which is described in 4.4.3. A mesh STA does not become associated as there is no central entity in a mesh BSS (MBSS). Instead, a mesh STA peers with other mesh STAs.

4.3.4 Distribution system (DS) concepts

4.3.4.1 Overview

PHY limitations determine the direct station-to-station distance that may be supported. For some networks this distance is sufficient; for other networks, increased coverage is required.

Instead of existing independently, an infrastructure BSS may also form a component of an extended form of network that is built with multiple BSSs. The architectural component used to interconnect infrastructure BSSs is the DS.
IEEE Std 802.11 logically separates the WM from the distribution system medium (DSM). Each logical medium is used for different purposes, by a different component of the architecture. The IEEE 802.11 definitions neither preclude, nor demand, that the multiple media be either the same or different.

Recognizing that the multiple media are logically different is key to understanding the flexibility of the architecture. The IEEE 802.11 LAN architecture is specified independently of the physical characteristics of any specific implementation.

The DS enables mobile device support by providing the logical services necessary to handle address to destination mapping and seamless integration of multiple BSSs.

An access point (AP) is any entity that has STA functionality and enables access to the DS, via the WM for associated STAs.

Figure 4-2 adds the DS, DSM and AP components to the IEEE 802.11 architecture picture.

Data move between a BSS and the DS via an AP. Note that all APs are also STAs; thus they are addressable entities. The addresses used by an AP for communication on the WM and on the DSM are not necessarily the same.

Data sent to the AP’s STA address by one of the STAs associated with it are always received at the uncontrolled port for processing by the IEEE 802.1X port access entity. In addition, if the controlled port is authorized, these frames conceptually transit the DS.

4.3.4.2 Extended service set (ESS): The large coverage network

The DS and infrastructure BSSs allow IEEE Std 802.11 to create a wireless network of arbitrary size and complexity. IEEE Std 802.11 refers to this type of network as the ESS network. An ESS is the union of the infrastructure BSSs with the same SSID connected by a DS. The ESS does not include the DS.

The key concept is that the ESS network appears the same to an LLC layer as an IBSS network. STAs within an ESS may communicate and mobile STAs may move from one BSS to another (within the same ESS) transparently to LLC.

Owing to its distributed nature, a mesh BSS (MBSS) has no central entity like the AP of an infrastructure BSS. Instead, an MBSS forms a single set of independent mesh STAs. This set is indivisible and cannot be
further unified. The ESS concept does not apply to the MBSS. However, it is possible to use a Mesh BSS as all or part of the DS that connects an ESS.

Nothing is assumed by IEEE Std 802.11 about the relative physical locations of the BSSs in Figure 4-3.

All of the following are possible
a) The BSSs partially overlap. This is commonly used to arrange contiguous coverage within a physical volume.
b) The BSSs could be physically disjoint. Logically there is no limit to the distance between BSSs.
c) The BSSs are physically collocated. This could be done to provide redundancy.
d) One (or more) IBSS or ESS networks are physically present in the same location as one (or more) ESS networks. This could arise for a number of reasons. Some examples are when an IBSS network is operating in a location that also has an ESS network, when physically overlapping IEEE 802.11 networks have been set up by different organizations, and when two or more different access and security policies are needed in the same location.

4.3.4.3 Robust security network association (RSNA)

An RSNA defines a number of security features in addition to wired equivalent privacy (WEP) and IEEE 802.11 authentication. These features include the following:
- Enhanced authentication mechanisms for STAs
- Key management algorithms
- Cryptographic key establishment
- Enhanced data cryptographic encapsulation mechanisms, such as Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP), and, optionally, Temporal Key Integrity Protocol (TKIP).
- Fast basic service set (BSS) transition (FT) mechanism
- Enhanced cryptographic encapsulation mechanisms for robust management frames

An RSNA may rely on components external to the IEEE 802.11 architecture.

The first component is an IEEE 802.1X port access entity (PAE). PAEs are present on all STAs in an RSNA and control the forwarding of data to and from the medium access control (MAC). An AP always implements the Authenticator PAE and Extensible Authentication Protocol (EAP) Authenticator roles, and a
non-AP STA always implements the Supplicant PAE and EAP peer roles. In an IBSS each STA implements both the Authenticator PAE and Supplicant PAE roles and both EAP Authenticator and EAP peer roles.

A second component is the Authentication Server (AS). The AS may authenticate the elements of the RSNA itself, i.e., the STAs may provide material that the RSNA elements use to authenticate each other. The AS communicates through the IEEE 802.1X Authenticator with the IEEE 802.1X Supplicant on each STA, enabling the STA to be authenticated to the AS and vice versa. An RSNA depends upon the use of an EAP method that supports mutual authentication of the AS and the STA, such as those that meet the requirements in IETF RFC 4017. In certain applications, the AS may be integrated into the same physical device as the AP, or into a STA in an IBSS.

In some applications, there is no need for a PAE or AS, and a STA and AP, or two STAs in an IBSS, or two mesh STAs in an MBSS, may authenticate each other using a password.

An RSNA using fast BSS transition relies on an external protocol to distribute keys between the pairwise master key (PMK) R0 key holder (R0KH) and PMK-R1 key holder (R1KH) Authenticator components. The requirements for this protocol are described in 12.2.2.

### 4.3.5 Area concepts

For wireless PHYs, well-defined coverage areas simply do not exist. Propagation characteristics are dynamic and unpredictable. Small changes in position or direction may result in dramatic differences in signal strength. Similar effects occur whether a STA is stationary or mobile (as moving objects may impact station-to-station propagation).

Figure 4-4 shows a signal strength map for a simple square room with a standard metal desk and an open doorway. Figure 4-4 is a static snapshot; the propagation patterns change dynamically as STAs and objects in the environment move. In Figure 4-4 the dark (solid) blocks in the lower left are a metal desk and there is a doorway at the top right of the figure. The figure indicates relative differences in field strength with different intensities and indicates the variability of field strength even in a static environment. The difference between the greatest signal strength and the least signal strength in Figure 4-4 is 50 dB.

While the architecture diagrams show sharp boundaries for BSSs, this is an artifact of the pictorial representation, not a physical reality. Because dynamic three-dimensional field strength pictures are difficult to draw, well-defined shapes are used by IEEE 802.11 architectural diagrams to represent the coverage of a BSS.

Further description difficulties arise when attempting to describe collocated coverage areas. Consider Figure 4-5, in which STA 6 could belong to BSS 2 or BSS 3.

While the concept of sets of STAs is correct, it is often convenient to talk about areas. For many topics the concept of area is sufficient. Volume is a more precise term than area, though still not technically correct. For historical reasons and convenience, this standard uses the common term *area.*
4.3.6 Integration with wired LANs

To integrate the IEEE 802.11 architecture with a traditional wired LAN, a final *logical* architectural component is introduced—a *portal*.

A portal is the logical point at which MSDUs from an integrated non-IEEE-802.11 LAN enter the IEEE 802.11 DS. For example, a portal is shown in Figure 4-6 connecting to a wired IEEE 802 LAN.
All data from non-IEEE-802.11 LANs enter the IEEE 802.11 architecture via a portal. The portal is the logical point at which the integration service is provided. The integration service is responsible for any addressing changes that might be required when MSDUs pass between the DS and the integrated LAN. It is possible for one device to offer both the functions of an AP and a portal.

4.3.7 QoS BSS: The QoS network

The IEEE 802.11 QoS facility provides MAC enhancements to support LAN applications with QoS requirements. The QoS enhancements are available to QoS STAs associated with a QoS access point in a QoS BSS. A subset of the QoS enhancements is available for use between STAs that are members of the same QoS IBSS. Similarly, a subset of the QoS enhancements is available for use between neighbor peer mesh STAs. A mesh BSS is one type of QoS BSS and it is described in 4.3.15. Because a nonmesh QoS STA implements a superset of STA functionality, as defined in this standard, the STA might associate with a non-QoS access point in a non-QoS BSS, to provide non-QoS MAC data service when there is no QoS BSS with which to associate. As a mesh STA does not implement the necessary service, the mesh STA does not associate with any access point.

The enhancements that distinguish QoS STAs from non-QoS STAs and QoS APs from non-QoS APs are collectively termed the QoS facility. Which of the QoS-specific mechanisms a QoS STA supports might vary among QoS implementations, as well as between QoS STAs and QoS APs, over ranges specified in subsequent clauses. All service primitives, frame formats, coordination function and frame exchange rules, and management interface functions except for the Block Acknowledgment (Block Ack) function, direct-link setup (DLS), and automatic power save delivery (APSD) are part of the core QoS facilities. A QoS STA or QoS AP implements those core QoS facilities necessary for its QoS functions to interoperate with other QoS STAs. Functions such as the Block Ack, DLS, and APSD are separate from the core QoS facilities; and the presence of these functions is indicated by STAs separately from the core QoS facilities.

For infrastructure BSS and IBSS, this standard provides two mechanisms for the support of applications with QoS requirements.

The first mechanism, designated the enhanced distributed channel access (EDCA), delivers traffic based on differentiating user priorities (UPs). This differentiation is achieved by varying the following for different UP values:

- Amount of time a STA senses the channel to be idle before backoff or transmission, or
— The length of the contention window to be used for the backoff, or
— The duration a STA may transmit after it acquires the channel.

These transmissions may also be subject to certain channel access restrictions in the form of admission control. Details of this mechanism are provided in 9.19.2.

The second mechanism, designated the hybrid coordination function (HCF) controlled channel access (HCCA), allows for the reservation of transmission opportunities (TXOPs) with the hybrid coordinator (HC). A STA based on its requirements requests the HC for TXOPs, both for its own transmissions as well as for transmissions from the AP to itself. The request is initiated by the station management entity (SME) of the STA. The HC, which is collocated at the AP, either accepts or rejects the request based on an admission control policy. If the request is accepted, the HC schedules TXOPs for both STAs (both the AP and the non-AP STA). For transmissions from the non-AP STA, the HC polls the STA based on the parameters supplied by the STA at the time of its request. For transmissions to the STA, the AP directly obtains TXOPs from the collocated HC and delivers the queued frames to the STA, again based on the parameters supplied by the STA. Details of the mechanism are provided in 9.19.3 and 10.4. This mechanism may be used for applications such as voice and video, which may need periodic service from the HC. If the application constraints dictate the use of this mechanism, the application initiates this mechanism by using the management service primitives.

Non-QoS STAs may associate in a QoS BSS, if allowed to associate by the AP. All individually addressed frames that are sent to non-QoS STAs by an AP do not use the frame formats associated with the QoS facility.

A QoS STA associated in a non-QoS BSS acts as a non-QoS STA.

4.3.8 Wireless LAN Radio Measurements

4.3.8.1 General

Wireless LAN (WLAN) Radio Measurements enable STAs to understand the radio environment in which they exist. WLAN Radio Measurements enable STAs to observe and gather data on radio link performance and on the radio environment. A STA may choose to make measurements locally, request a measurement from another STA, or may be requested by another STA to make one or more measurements and return the results. Radio Measurement data is made available to STA management and upper protocol layers where it may be used for a range of applications. The measurements enable adjustment of STA operation to better suit the radio environment. The Radio Measurement service includes measurements that extend the capability, reliability, and maintainability of WLANs by providing standard measurements across vendors, and the service provides the resulting measurement data to upper layers in the communications stack.

In addition to featuring standard measurements and delivering measurement information to upper layers, there are applications that require quantifiable radio environment measurements in order to attain the necessary performance levels. These applications include VoIP, video over IP, location based applications, as well as applications requiring mitigation of harsh radio environments (multifamily dwellings, airplanes, factories, municipalities, etc.). Radio Measurements address most of the existing issues in using unlicensed radio spectrum to meet the requirements of these emerging technologies.

To address the mobility requirements of technologies, such as VoIP and video streaming, Radio Measurements, such as Channel Load request/report and the Neighbor request/report, may be used to collect transition information, which can drastically speed up handoffs between BSSs within the same ESS. By accessing and using this information, the STAs (either in APs or in non-AP STAs) can make intelligent

16 In the case of downlink traffic streams (TSs).
decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The request/report measurements are as follows:

- beacon
- frame
- channel load
- noise histogram
- STA statistics
- location configuration information (LCI)
- neighbor report
- link measurement
- transmit stream/category measurement

The request-only mechanism is as follows:

- measurement pause

The report-only mechanism is as follows:

- measurement pilot

These measurement mechanisms provide the capability for a STA to manage and query its radio environment, and to make appropriate assessments about its health and efficiency. It is the first step in making WLAN smart and capable of making appropriate decisions for fast transition, for mesh connectivity, and for managing the radio environment for all wireless devices.

4.3.8.2 Beacon

The Beacon request/report pair enables a STA to request from another STA a list of APs whose beacons it can receive on a specified channel or channels. This measurement may be done by active mode (like active scan), passive mode (like passive scan), or beacon table modes. If the measurement request is accepted and is in passive mode, a duration timer is set. Then the measuring STA monitors the requested channel; measures beacon, probe response, and measurement pilot power levels (received channel power indicator (RCPI)); and logs all beacons, probe responses, and measurement pilots received within the measurement duration. If the measurement request is in active mode, the measuring STA sends a probe request on the requested channel at the beginning of the measurement duration; then monitors the requested channel; measures beacon, probe response, and measurement pilot power levels (RCPI); and logs all beacons, probe responses, and measurement pilots received within the measurement duration. If the request is beacon table mode, then the measuring STA returns a Beacon Report containing the current contents of any stored beacon information for any supported channel with the requested service set identifier (SSID) and basic service set identifier (BSSID) without performing additional measurements.

4.3.8.3 Measurement Pilot

The Measurement Pilot frame provides a subset of the information provided in a Beacon frame, is smaller than a Beacon, and is transmitted more often than a Beacon. The purpose of the Measurement Pilot frame is to assist a STA with scanning.

4.3.8.4 Frame

The frame request/report pair returns a picture of all the channel traffic and a count of all the frames received at the measuring STA. For each unique Transmitter Address, the STA reports the Transmitter Address,
number of frames received from this transmitter, average power level (RCPI) for these frames, and BSSID of the transmitter.

4.3.8.5 Channel load

The channel load request/report pair returns the channel utilization measurement as observed by the measuring STA.

4.3.8.6 Noise histogram

The noise histogram request/report pair returns a power histogram measurement of non-IEEE 802.11 noise power by sampling the channel when virtual carrier sense indicates idle and the STA is neither transmitting nor receiving a frame.

4.3.8.7 STA statistics

The STA statistics request/report pair returns groups of values for STA counters and for BSS Average Access Delay. The STA counter group values include transmitted fragment counts, group addressed transmitted frame counts, failed counts, retry counts, multiple retry counts, frame duplicate counts, Request to Send (RTS) success counts, RTS failure counts, Acknowledgement (ACK) failure counts, received fragment counts, group addressed received frame counts, FCS error counts, and transmitted frame counts. BSS Average Access Delay group values include AP average access delay, average access delay for each access category, associated STA count, and channel utilization.

4.3.8.8 Location

The Location request/report pair returns a requested location in terms of latitude, longitude, and altitude. It includes types of altitude such as floors and permits various reporting resolutions. The requested location may be the location of the requestor (e.g., Where am I?) or the location of the reporting STA (e.g., Where are you?)

4.3.8.9 Measurement pause

The measurement pause request is defined, but no report comes back from this request. The measurement pause permits the inclusion of a quantified delay between the execution of individual measurements that are provided in a series within a measurement request frame. The measurement pause used as the last measurement in a frame provides control of the measurement period when measurement request frames are to be repeated.

4.3.8.10 Neighbor report

The neighbor report request is sent to an AP, which returns a neighbor report containing information about known neighbor APs that are candidates for a service set transition. Neighbor reports contain information from the table dot11RMNeighborReportTable in the MIB concerning neighbor APs. This request/report pair enables a STA to gain information about the neighbors of the associated AP to be used as potential roaming candidates.

4.3.8.11 Link measurement

The link measurement request/report exchange provides measurements of the RF characteristics of a STA-to-STA link. This measurement indicates the instantaneous quality of a link.
4.3.8.12 Transmit stream/category measurement

The Transmit Stream/Category measurement is a request/report pair that enables a QoS STA to inquire of a peer QoS STA the condition of an ongoing traffic stream between them. The Transmit Stream/Category Measurement Report provides the transmit-side performance metrics for the measured traffic stream. Trigger conditions included in the Transmit Stream/Category Measurement Request may initiate triggered Transmit Stream/Category Measurement Reports upon detection of the trigger condition.

4.3.9 Operation in licensed frequency bands

4.3.9.1 General

IEEE 802.11 devices can operate on frequencies that are licensed by national regulatory bodies. Although this standard has been generalized so that it is independent of license type, band, and country of operation, only the bands and associated regulations listed in Annex D have been specifically considered.

4.3.9.2 Dynamic STA enablement (DSE) in licensed bands

The DSE operating procedures are used to automate the channel provisioning and regulatory controls needed for unregistered IEEE 802.11 STAs to operate as dependent STAs in licensed spectrum.17

4.3.9.3 Contention-Based Protocol (CBP) in nonexclusively licensed bands

The granting of licenses on a nonexclusive, uncoordinated basis in the same area leads to the possibility of overlapping networks. When overlapping networks cause co-channel interference, regulations, such as those governing the 3650 MHz band in the United States, require the use of a CBP “by which a transmitter provides reasonable opportunities for other transmitters to operate.”18 IEEE 802.11 carrier sense multiple access with collision avoidance (CSMA/CA) is suitable for this purpose in most situations.

4.3.9.4 Using DSE STA identification to resolve interference

When CSMA/CA is not able to sufficiently sense the presence of another licensee’s STA (i.e., a hidden STA) or if a secondary licensee causes interference to a primary licensee, the licensee is obliged to resolve complaints that result from interference caused by any STA under its control (including dependent STAs). In order to facilitate the interference resolution processes, all STAs operating in nonexclusively licensed spectrum use the DSE STA and location information procedures.

The STA identification and location information procedures are inherently tied because, by default, registered STAs broadcast their actual location as their unique identifier. Dependent STAs broadcast the location of the STA that has enabled them as well as a unique code selected by the licensee. This method puts a victim of the interference in contact with the party responsible for rectifying the problem, and, at the same time, it protects the privacy of the dependent STA’s operator.

4.3.9.5 Further coexistence enhancements in nonexclusively licensed bands

While not explicitly required to meet specific rules, a number of optional IEEE 802.11 mechanisms, when used together, are able to meet general requirements for spectrum sharing, incumbent detection, and other cognitive radio functions in licensed bands. The specific mechanisms for each band are detailed in E.2.

17In some licensed frequency bands, wireless equipment can be owned and operated by individuals who do not hold a license. In such instances, devices are permitted to operate only if they are either communicating with, or receiving permission to transmit from, a STA that is maintained by a licensed operator. The Japanese 4.9 GHz band and the U.S. 4.94–4.99 GHz public safety band are examples in which IEEE 802.11 STAs operate under such arrangements.

18Definition of CBP from FCC 05-56, Report and Order and Memorandum Opinion and Order, clause 58.
4.3.10 High-throughput (HT) STA

The IEEE 802.11 HT STA provides PHY and MAC features that can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP). An HT STA supports HT features as identified in Clause 9 and Clause 20. An HT STA operating in the 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 18. An HT STA operating in the 2.4 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 17 and Clause 19. An HT STA is also a QoS STA. The HT features are available to HT STAs associated with an HT AP in a BSS. A subset of the HT features is available for use between two HT STAs that are members of the same IBSS. Similarly, a subset of the HT features is available for use between two HT STAs that have established mesh peering (see 8.4.2.58 for details).

An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in 20.3.5 and physical layer convergence procedure (PLCP) protocol data unit (PPDU) formats described in 20.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as multiple input, multiple output (MIMO) operation; spatial multiplexing (SM); spatial mapping (including transmit beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield format. The PPDU may be transmitted with 20 MHz or 40 MHz bandwidth.

An HT STA has MAC features that include frame aggregation, some Block Ack features, power save multi-poll (PSMP) operation, reverse direction (RD), and protection mechanisms supporting coexistence with non-HT STAs.

4.3.11 STA transmission of data frames outside the context of a BSS

In addition to defining procedures for STA communication within a BSS, this standard also allows a STA that is not a member of a BSS to transmit data frames. Such data frames are defined as being transmitted outside the context of a BSS. A STA transmits a data frame outside the context of a BSS only if dot11OCBActivated is true.

NOTE—The specific frame subtypes that a STA is allowed to send when it has dot11OCBActivated true are specified in 10.20.

When dot11OCBActivated is true, a data frame can be sent to either an individual or a group destination MAC address. This type of communication is only possible between STAs that are able to communicate directly over the wireless medium. It allows immediate communication, avoiding the latency associated with establishing a BSS. When dot11OCBActivated is true, a STA is not a member of a BSS and it does not utilize the IEEE 802.11 authentication, association, or data confidentiality services. This capability is particularly well-suited for use in rapidly varying communication environments such as those involving mobile STAs in which the interval over which the communication exchanges take place may be of very short-duration (e.g., on the order of tens or hundreds of milliseconds). Since IEEE 802.11 MAC sublayer authentication services are not used when dot11OCBActivated is true, any required authentication services are provided by the station management entity (SME) or by applications outside of the MAC sublayer.

A STA whose MIB does not include the dot11OCBActivated attribute operates as if the attribute is false.

Communication of data frames when dot11OCBActivated is true might take place in a frequency band that is dedicated for its use, and such a band might require licensing depending on the regulatory domain. A STA for which dot11OCBActivated is true initially transmits and receives on a channel known in advance, either through regulatory designation or some other out-of-band communication. A STA’s SME determines PHY layer parameters, as well as any changes in the operating channel, e.g., using information obtained via out-of-band communication or over-the-air frame exchange. When dot11OCBActivated is true, a sending STA sets the BSSID field to the wildcard BSSID value (see 8.2.4.3.4).
The Vendor Specific frame (see 8.5.6) provides one means for STAs to exchange management information prior to communicating data frames outside the context of a BSS.

### 4.3.12 Tunneled direct-link setup

Tunneled direct-link setup (TDLS) is characterized by the use of signaling frames that are encapsulated in data frames so that the signaling frames are transmitted through an AP transparently. Therefore, unlike with DLS, the AP does not need to be direct-link aware, nor does it have to support the same set of capabilities that are used on the direct link, in order for TDLS to be used. To allow a STA to enter a TDLS power save mode, TDLS provides two power save mechanisms: TDLS peer U-APSD and TDLS peer PSM. TDLS allows STAs to use the TDLS Peer Key Handshake to provide data confidentiality and message authentication. STAs that set up a TDLS direct link remain associated with the AP and transmit frames directly to the other TDLS peer STA.

### 4.3.13 Wireless network management

#### 4.3.13.1 Overview

Wireless network management (WNM) enables STAs to exchange information for the purpose of improving the overall performance of the wireless network. STAs use WNM protocols to exchange operational data so that each STA is aware of the network conditions, allowing STAs to be more cognizant of the topology and state of the network. WNM protocols provide a means for STAs to be aware of the presence of collocated interference, and enable STAs to manage RF parameters based on network conditions.

In addition to providing information on network conditions, WNM also provides a means to exchange location information, provide support for the multiple BSSID capability on the same wireless infrastructure, support efficient delivery of group addressed frames, and enable a WNM-Sleep mode in which a STA can sleep for long periods of time without receiving frames from the AP.

The WNM service includes the following:
- BSS Max idle period management
- BSS transition management
- Channel usage
- Collocated interference reporting
- Diagnostic reporting
- Directed multicast service (DMS)
- Event reporting
- Flexible multicast service (FMS)
- Location services
- Multicast diagnostic reporting
- Multiple BSSID capability
- Proxy ARP
- QoS traffic capability
- SSID list
- Triggered STA statistics
- TIM broadcast
- Timing measurement
- Traffic filtering service
- U-APSD Coexistence
— WNM-Notification
— WNM-Sleep mode

4.3.13.2 BSS Max idle period management

BSS Max idle period management enables an AP to indicate a time period during which the AP does not
disassociate a STA due to nonreceipt of frames from the STA. This supports improved STA power saving
and AP resource management.

4.3.13.3 BSS transition management

BSS transition management enables an AP to request non-AP STAs to transition to a specific AP, or to
indicate to a non-AP STA a set of preferred APs, due to network load balancing or BSS Termination.

4.3.13.4 Channel usage

Channel usage information is provided by the AP to the non-AP STA to recommend channels for
noninfrastructure networks or an off-channel TDLS direct link. The non-AP STAs can use the channel usage
information as part of channel selection processing for a noninfrastructure network or an off-channel TDLS
direct link.

4.3.13.5 Collocated interference reporting

Collocated interference reporting enables the requesting STA to obtain information on interference due to
collocated radios at the reporting STA. The requesting STA can use that information to schedule its
transmissions to minimize the effects of the interference.

4.3.13.6 Diagnostic reporting

Diagnostic requests enable a STA to request a non-AP STA to report on information that may be helpful in
diagnosing and resolving problems with the WLAN network. Diagnostic reports include information on
hardware, configuration, and STA capabilities.

4.3.13.7 Directed multicast service (DMS)

The DMS enables a non-AP STA to request the AP to transmit group addressed frames destined to the
requesting STA as individually addressed frames.

4.3.13.8 Event reporting

Event requests enable a STA to request a non-AP STA to send particular real-time event messages. The
types of events include Transition, RSNA, WNM Log, and Peer-to-Peer Link events. A transition event is
transmitted after a non-AP STA successfully completes a BSS Transition. Transition events are used to
diagnose transition performance problems. An RSNA event report describes the type of Authentication used
for the RSNA. RSNA events are used to diagnose security and authentication performance problems. A
WNM Log event report enables a non-AP STA to transmit a set of WNM Log event messages to the
requesting STA. WNM Log event reports are used to access the contents of a STA’s WNM Log. A Peer-to-
Peer Link event report enables a non-AP STA to inform the requesting STA that a Peer-to-Peer link has been
established. Peer-to-Peer Link event reports are used to monitor the use of Peer-to-Peer links in the network.
4.3.13.9 FMS

The flexible multicast service enables a non-AP STA to request an alternate delivery traffic indication map (DTIM) delivery interval for one or more sets of group addressed streams that the non-AP STA receives. This enables the non-AP STA to wake up at the alternate DTIM interval rather than every DTIM and enables significant power saving when a non-AP STA receives group addressed traffic. The FMS also enables a STA to establish a data rate and delivery interval for group addressed traffic higher than the minimum data rate available.

Delivery of group addressed data to power saving STAs using a DTIM beacon is described in 10.2.1.4.

4.3.13.10 Location services

Location Configuration Request and Response frames enable STAs to configure a collection of location related parameters for Location Track Notification frames. The AP can indicate that it can provide location data to support applications such as emergency services. Location services also provide the ability for STAs to exchange location information using Radio Measurement Request and Report frames. The protocol supports exchange-by-value and exchange-by-reference mechanisms. The location value can be exchanged in Geospatial (LCI) and Civic formats. The location reference is a URL that defines from where the location value is retrieved.

4.3.13.11 Multicast diagnostic reporting

Multicast diagnostic reports enable a non-AP STA to report statistics for multicast traffic it received from a transmitting STA. This can be used by an AP to measure quality of multicast reception by a non-AP STA.

4.3.13.12 Multiple BSSID capability

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single Beacon or Probe Response frame instead of multiple Beacon and Probe Response frames, each corresponding to a single BSSID. The Multiple BSSID capability also enables the indication of buffered frames for multiple BSSIDs using a single TIM element in a single beacon.

4.3.13.13 Proxy ARP

The Proxy ARP capability enables an AP to indicate that the non-AP STA does not receive ARP frames. The Proxy ARP capability enables the non-AP STA to remain in power save for longer periods of time.

4.3.13.14 QoS traffic capability

QoS traffic capability procedures enable the QoS STA to indicate that it is capable of transmitting traffic belonging to the corresponding user priority (UP) from applications that require generation of such traffic. The QoS Traffic Capability might be used for example as an input to estimate the blocking probability of a voice application based on the number of voice capable non-AP STAs.

4.3.13.15 SSID list

The SSID List element enables the non-AP STA to request information on a list of SSIDs. This is intended to reduce the number of Probe Request frames sent by the non-AP STA.

4.3.13.16 Triggered STA statistics

The Triggered STA Statistics reporting capability enables generation of a STA statistics report (see 4.3.8.9) when the statistics of interest reach a predefined threshold.
4.3.13.17 TIM broadcast

The TIM broadcast protocol defines a mechanism to enable a STA to receive an indication of buffered individually addressed traffic, independent of the Beacon frame, reducing the wake time of the STA.

4.3.13.18 Timing measurement

Timing Measurement frames allow a recipient STA to accurately measure the offset of its clock relative to a clock in the sending STA. With the regular transfer of Timing Measurement frames from one STA to another, it is possible for the recipient STA to track changes in the offset of its clock with respect to the sending STA over time and thus detect and compensate for any drift between the clocks.

4.3.13.19 Traffic filtering service

Traffic filtering is a service that may be provided by an AP to its associated STAs, where the AP examines MSDUs and management frames destined for a STA. The AP determines if any of those frames match a specific set of traffic filters that may be enabled at the AP per the request of the STA. Individually addressed frames that do not match any of the traffic filters in the set are discarded. Individually addressed frames that do match at least one of the set of the enabled traffic filters are delivered to the STA. The STA may also negotiate to have a notification frame sent prior to the delivery of the frame matching the traffic filter.

4.3.13.20 U-APSD Coexistence

The U-APSD Coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use of U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD Coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received successfully.

4.3.13.21 WNM-Notification

WNM-Notification provides a mechanism for a STA to notify another STA of a management event. One event is defined: firmware update notification.

4.3.13.22 WNM-Sleep mode

WNM-Sleep mode is an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM Beacon frame, and need not perform GTK/IGTK updates. WNM-Sleep mode enables a non-AP STA to signal to an AP that it will be sleeping for a specified length of time. This enables a non-AP STA to reduce power consumption and remain associated while the non-AP STA has no traffic to send to or receive from the AP.

4.3.14 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 4-7. The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the Portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 10.24.5.
The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. SSPN access may involve virtual local area network (VLAN) mapping or tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

4.3.15 Mesh BSS: IEEE 802.11 wireless mesh network

4.3.15.1 General

The IEEE 802.11 mesh facility provides MAC enhancements to support wireless LAN mesh topologies. The mesh facilities are available to mesh STAs that belong to a mesh BSS (MBSS). For a mesh STA that has not become a member of an MBSS, only the mesh discovery service is available. The enhancements that distinguish mesh STAs from nonmesh STAs are collectively termed the “mesh facility.” The mesh-specific mechanisms vary among implementations.

4.3.15.2 Overview of the mesh BSS

A mesh BSS is an IEEE 802.11 LAN consisting of autonomous STAs. Inside the mesh BSS, all STAs establish wireless links with neighbor STAs to mutually exchange messages. Further, using the multi-hop capability, messages can be transferred between STAs that are not in direct communication with each other over a single instance of the wireless medium. From the data delivery point of view, it appears as if all STAs in a mesh BSS are directly connected at the MAC layer even if the STAs are not within range of each other. The multi-hop capability enhances the range of the STAs and benefits wireless LAN deployments.
STAs in a mesh BSS might be sources, sinks, or propagators of traffic; some mesh STAs might only propagate traffic for other STAs. As described in 4.3.15.4, a mesh BSS might have interfaces to external networks and can be a DSM for infrastructure BSSs.

Within a mesh BSS, STAs utilize the mesh coordination function (MCF) to access the channel. MCF is based on the core QoS facilities specified in 4.3.7, and a mesh BSS is categorized as one type of QoS BSS. MCF is described in 9.20.

### 4.3.15.3 Mesh STA

A STA that belongs to a mesh BSS is termed a “mesh station” (mesh STA). Mesh STAs are QoS STAs that support mesh services, i.e., they participate in formation and operation of a mesh basic service set (MBSS). A mesh STA implements a subset of the QoS functionality:

- Use of QoS frame format
- EDCA (as a part of MCF)
- Block acknowledgement (optional)
- No acknowledgement (optional)

A mesh BSS does not incorporate the full hybrid coordinator (HC) and BSS QoS functionality. MBSSs do not incorporate the following:

- HCCA
- Traffic specifications (TSPECs)
- Traffic stream (TS) management
- Admission control
- Automatic power save delivery (APSD)
- Direct-link setup (DLS)
- Tunneled direct-link setup (TDLS)

### 4.3.15.4 IEEE 802.11 components and mesh BSS

Example mesh and infrastructure BSSs are illustrated in Figure 4-8. Only mesh STAs participate in mesh functionalities such as formation of the mesh BSS, path selection, and forwarding. Accordingly, a mesh STA is not a member of an IBSS or an infrastructure BSS. Consequently, mesh STAs do not communicate with nonmesh STAs.

However, instead of existing independently, an MBSS might also access the distribution system (DS). The MBSS interconnects with other BSSs through the DS. Then, mesh STAs can communicate with nonmesh STAs. Therefore, a logical architectural component is introduced in order to integrate the MBSS with the DS—the mesh gate. Data move between an MBSS and the DS via one or more mesh gates. Thus, the mesh gate is the logical point at which MSDUs from an MBSS enter the IEEE 802.11 DS. Once an MBSS contains a mesh gate that connects it to the IEEE 802.11 DS, the MBSS can be integrated with other infrastructure BSSs too, given that their APs connect to the same DS. Several mesh gates are shown in Figure 4-8 connecting different MBSSs to the DS.

When an MBSS accesses the IEEE 802.11 DS through its mesh gate, the MBSS can be integrated with a non-IEEE-802.11 LAN. To integrate the IEEE 802.11 DS to which this MBSS connects, the DS needs to contain a portal. See 4.3.6. Consequently, mesh gate and portal are different entities. The portal integrates the IEEE 802.11 architecture with a non-IEEE-802.11 LAN (e.g., a traditional wired LAN), whereas the mesh gate integrates the MBSS with the IEEE 802.11 DS.
It is possible for one device to offer any combination of the functions of an AP, a portal, and a mesh gate; see 13.11.5. An example device combining the functions of an AP and a mesh gate is shown in Figure 4-9. The implementation of such collocated entities is beyond the scope of this standard. The configuration of a mesh gate that is collocated with an access point allows the utilization of the mesh BSS as a distribution system medium. In this case, two different entities (mesh STA and access point) exist in the collocated device and the mesh BSS is hidden to STAs that associate to the access point. The mesh STA collocation is outlined in 13.11.5, which states that the usage of a distinct MAC address for each collocated STA avoids ambiguities.

**Figure 4-9—Example device consisting of mesh STA and AP STA to connect an MBSS and an infrastructure BSS**

### 4.3.15.5 Introduction to mesh functions

#### 4.3.15.5.1 General

A mesh BSS is formed and operated by the set of services called mesh services. Mesh services are provided by the following major mesh facilities:

- Mesh discovery
- Mesh peering management
- Mesh security
- Mesh beaconing and synchronization
- Mesh coordination function
- Mesh power management
- Mesh channel switching
- Three address, four address, and extended address frame formats
- Mesh path selection and forwarding
- Interworking with external networks
- Intra-mesh congestion control
- Emergency service support in mesh BSS
4.3.15.5.2 Mesh discovery

A mesh STA performs either active scanning or passive scanning to discover an operating mesh BSS. Each mesh STA transmits Beacon frames periodically and responds with Probe Response frames when a Probe Request frame is received, so that neighbor mesh STAs can perform mesh discovery appropriately. The identification of the mesh BSS is given by the Mesh ID element contained in the Beacon and the Probe Response frames. The details for the mesh discovery facility are described in 13.2.

4.3.15.5.3 Mesh peering management (MPM)

Within a mesh BSS, direct communication between neighbor mesh STAs is allowed only when they are peer mesh STAs. After mesh discovery, two neighbor mesh STAs agree to establish a mesh peering to each other, and, after successfully establishing the mesh peering, they become peer mesh STAs. A mesh STA can establish a mesh peering with multiple neighbor mesh STAs. The mesh peering management (MPM) facilitates the mesh peering establishment and closure of the mesh peerings. The details of MPM are described in 13.3.

4.3.15.5.4 Mesh security

In an MBSS, mesh link security protocols are used to authenticate a pair of mesh STAs and to establish session keys between them. Mesh authentication protocols establish a shared, common pairwise master key (PMK), and authenticate a peer mesh STA. The authenticated mesh peering exchange protocol relies on the existence of the PMK between the two mesh STAs to establish an authenticated peering and derive session keys. The details of mesh security are described in 11.3, 13.3.3, 13.5, and 13.6.

4.3.15.5.5 Mesh beaconing and synchronization

In order to assist mesh discovery, mesh power management, and synchronization in a mesh BSS, all mesh STAs periodically transmit Beacon frames. Synchronization in a mesh BSS is maintained by the MBSS’s active synchronization method. The default synchronization method is the neighbor offset synchronization method. Mesh beacon collision avoidance (MBCA) mitigates collisions of Beacon frames among hidden nodes. The details of mesh beaconing and synchronization are described in 13.13.

4.3.15.5.6 Mesh coordination function (MCF)

A mesh STA uses the mesh coordination function (MCF) for channel access. MCF consists of EDCA (contention-based channel access defined in 9.20.2) and MCCA (controlled channel access defined in 9.20.3). MCCA is a reservation based channel access method and aims to optimize the efficiency of frame exchanges in a mesh BSS.

4.3.15.5.7 Mesh power management

A mesh STA can manage the activity level of its links per mesh peering. A mesh STA sets the activity level of each of its mesh peerings to either active mode, light sleep mode, or deep sleep mode. The mesh STA performs mesh power mode tracking for each of its neighbor peer mesh STAs, and delivers the frames based on the rules defined in 13.14.

4.3.15.5.8 Mesh channel switching

When a mesh STA switches the operating channel, it uses the channel switch protocol defined in 10.9.8 and 10.10. The channel switch protocol enables the propagation of channel switching messages throughout the mesh BSS, prior to the channel switch execution.
4.3.15.5.9 Frame addressing in an MBSS

Three address, four address, and extended address frame formats enable the distribution of messages over multiple instances of the wireless medium within a mesh BSS and integration to the ESS. Frame format details are described in Clause 8 and 9.32.3.

4.3.15.5.10 Mesh path selection and forwarding

Mesh path selection enables path discovery over multiple instances of the wireless medium within a mesh BSS. The overview of the mesh path selection framework is described in 13.8. The hybrid wireless mesh protocol (HWMP) is defined as the default path selection protocol for the mesh BSS. HWMP provides both proactive path selection and reactive path selection. The details of HWMP are described in 13.10. The path selection protocol uses link metrics in the assessment of a mesh path to the destination. The airtime link metric is the default link metric. It is defined in 13.9.

Once the mesh path of a particular pair of the source mesh STA and the destination mesh STA is found through the mesh path selection function, mesh STAs propagate the data by the forwarding function. The details of the forwarding function are described in 9.32.

As a result of the mesh path selection and forwarding, MSDUs are transmitted among all the mesh STAs in a mesh BSS, even if the mesh STAs are not neighbor STAs of each other. Figure 4-10 depicts the MSDU transfer within a mesh BSS.

![Figure 4-10—MAC data transport over an MBSS](image)

4.3.15.5.11 Interworking with the DS

A mesh BSS might contain one or more mesh gates that connect to one or more distribution systems. A mesh gate can announce its presence in the mesh BSS by sending Gate Announcement frames. Alternatively a mesh gate can announce its presence in the mesh BSS by sending HWMP Path Selection frames with the RANN element or the PREQ element indicating mesh gate announcement, when it is configured as a root mesh STA. Typically a mesh gate announces its presence when it is collocated with a portal or it has access.
to a portal. Gate announcements allow mesh STAs to select the appropriate mesh gate and build a path towards it. It should be noted that, when multiple mesh gates that have access to the same DS are present in the mesh BSS, proper configuration is necessary.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS, the mesh gate acts as a proxy for the IEEE 802 STAs outside the MBSS. Such a mesh gate is called a proxy mesh gate. The details of the proxy functionality are described in 13.11.3.

The details of the mesh BSS interworking are described in 13.11.

4.3.15.5.12 Intra-mesh congestion control

Intra-mesh congestion control is used to provide flow control over the multi-hop communication. Intra-mesh congestion control is useful to mitigate wasteful wireless medium utilization caused by buffer overflow at mesh STAs. Intra-mesh congestion control consists of three main mechanisms: local congestion monitoring and congestion detection, congestion control signaling, and local rate control. The details of the intra-mesh congestion control are described in 13.12.

4.3.15.5.13 Emergency service support in mesh BSS

Depending on regulations, emergency services support might be mandated over the mesh network. In this case the Beacon and Probe Response frames inform whether a mesh STA supports emergency services, advertising to other mesh STAs that mesh peering for emergency services is possible. If a mesh STA subsequently requires emergency services, an emergency indication is then set within the Mesh Peering Open frame. Mesh STAs that support emergency services, accept peering from other mesh STAs requiring emergency services, transferring frames to an emergency server (such as a PSAP).

4.4 Logical service interfaces

4.4.1 General

A DS may be created from many different technologies including current IEEE 802 wired LANs. IEEE Std 802.11 does not constrain the DS to be either data link or network layer based. Nor does IEEE Std 802.11 constrain a DS to be either centralized or distributed in nature.

IEEE Std 802.11 explicitly does not specify the details of DS implementations. Instead, IEEE Std 802.11 specifies services. The services are associated with different components of the architecture. There are two categories of IEEE 802.11 service—the station service (SS) and the distribution system service (DSS). Both categories of service are used by the IEEE 802.11 MAC sublayer.

The complete set of IEEE 802.11 architectural services are as follows:

a) Authentication
b) Association
c) Deauthentication
d) Disassociation
e) Distribution
f) Integration
g) Data confidentiality
h) Reassociation
i) MSDU delivery
j) DFS
k) TPC  
l) Higher layer timer synchronization (QoS facility only)  
m) QoS traffic scheduling (QoS facility only)  
n) Radio measurement  
o) DSE

This set of services is divided into two groups: the SS and the DSS. The SS is part of every STA. The DSS is provided by the DS.

### 4.4.2 SS

The service provided by STAs is known as the SS.

The SS is present in every IEEE 802.11 STA (including APs, as APs include STA functionality). The SS is specified for use by MAC sublayer entities. All conformant STAs provide SS.

The SS is as follows:

a) Authentication (not used when dot11OCBActivated is true)  
b) Deauthentication (not used when dot11OCBActivated is true)  
c) Data confidentiality (not used when dot11OCBActivated is true)  
d) MSDU delivery  
e) DFS  
f) TPC  
g) Higher layer timer synchronization (QoS facility only)  
h) QoS traffic scheduling (QoS facility only)  
i) Radio measurement  
j) DSE

### 4.4.3 DSS

The service provided by the DS is known as the DSS.

This service is represented in the IEEE 802.11 architecture by arrows within APs and mesh gates, indicating that the service is used to cross media and possibly address space logical boundaries. An AP and a mesh gate are logical entities, and the functions described may be shared by one or more physical entities.

The services that comprise the DSS are as follows:

a) Association (not mesh facility)  
b) Disassociation (not mesh facility)  
c) Distribution  
d) Integration  
e) Reassociation (not mesh facility)  
f) QoS traffic scheduling (QoS facility only)  
g) DSE  
h) Interworking with the DS (mesh facility only)

DSSs are specified for use by MAC sublayer entities.
Figure 4-11 combines the components from previous figures with both types of services to show the complete IEEE 802.11 architecture.

![Complete IEEE 802.11 architecture](image)

**Figure 4-11—Complete IEEE 802.11 architecture**

### 4.5 Overview of the services

#### 4.5.1 General

There are many services specified by IEEE Std 802.11. Six of the services are used to support medium access control (MAC) service data unit (MSDU) delivery between STAs. Three of the services are used to control IEEE 802.11 LAN access and confidentiality. Two of the services are used to provide spectrum management. One of the services provides support for LAN applications with QoS requirements. Another of the services provides support for higher layer timer synchronization. One of the services is used for radio measurement.

This subclause presents the services, an overview of how each service is used, and a description of how each service relates to other services and the IEEE 802.11 architecture. The services are presented in an order designed to help build an understanding of the operation of an IEEE 802.11 ESS network. As a result, the services that comprise the SS and DSS are intermixed in order (rather than being grouped by category).

Each of the services is supported by one or more MAC frame types. Some of the services are supported by MAC management messages and some by MAC data messages. All of the messages gain access to the WM via the IEEE 802.11 MAC sublayer medium access method specified in Clause 9.

The IEEE 802.11 MAC sublayer uses three types of messages—*data*, *management*, and *control* (see Clause 8). The data messages are handled via the MAC data service path.

MAC management messages are used to support the IEEE 802.11 services and are handled via the MAC management service path.

MAC control messages are used to support the delivery of IEEE 802.11 data and management messages.
The examples here assume an ESS network environment. The differences between the ESS and the IBSS network environments are discussed separately in 4.7.

4.5.2 Distribution of messages within a DS

4.5.2.1 Distribution

This is the primary service used by IEEE 802.11 STAs. It is conceptually invoked by every data message to or from an IEEE 802.11 STA operating in an ESS (when the frame is sent via the DS). Distribution is via the DSS.

Refer to the ESS network in Figure 4-11 and consider a data message being sent from STA 1 to STA 4. The message is sent from STA 1 and received by STA 2 (the “input” AP). The AP gives the message to the distribution service of the DS. It is the job of the distribution service to deliver the message within the DS in such a way that it arrives at the appropriate DS destination for the intended recipient. In this example, the message is distributed to STA 3 (the “output” AP) and STA 3 accesses the WM to send the message to STA 4 (the intended destination).

How the message is distributed within the DS is not specified by IEEE Std 802.11. All IEEE Std 802.11 is required to do is to provide the DS with enough information for the DS to be able to determine the “output” point that corresponds to the intended recipient. The necessary information is provided to the DS by the three association related services (association, reassociation, and disassociation).

The previous example was a case in which the AP that invoked the distribution service was different from the AP that received the distributed message. If the message had been intended for a STA that was a member of the same BSS as the sending STA, then the “input” and “output” APs for the message would have been the same.

In either example, the distribution service was logically invoked. Whether the message actually had to traverse the physical DSM or not is a DS implementation matter and is not specified by this standard.

While IEEE Std 802.11 does not specify DS implementations, it does recognize and support the use of the WM as one possible DSM. This is specifically supported by the IEEE 802.11 frame formats. (Refer to Clause 8 for details.) A mesh BSS might form an entire DS or a part of a DS using the WM, as shown in Figure 4-8. Mesh services are used to form a mesh BSS and distribute messages. Clause 13 defines how mesh BSSs are formed and how messages are distributed through a mesh BSS.

4.5.2.2 Integration

If the distribution service determines that the intended recipient of a message is a member of an integrated LAN, the “output” point of the DS would be a portal instead of an AP.

Messages that are distributed to a portal cause the DS to invoke the Integration function (conceptually after the distribution service). The Integration function is responsible for accomplishing whatever is needed to deliver a message from the DSM to the integrated LAN media (including any required media or address space translations). Integration is one of the services in the DSS.

Messages received from an integrated LAN (via a portal) by the DS for an IEEE 802.11 STA invoke the Integration function before the message is distributed by the distribution service.

The details of an Integration function are dependent on a specific DS implementation and are outside the scope of this standard.
4.5.2.3 QoS traffic scheduling

QoS traffic scheduling provides intra-BSS QoS frame transfers under the HCF, using either contention-based or controlled channel access. At each TXOP, a traffic scheduling entity at the STA selects a frame for transmission, from the set of frames at the heads of a plurality of traffic queues, based on requested UP and/or parameter values in the traffic specification (TSPEC) for the requested MSDU. Additional information is available in 9.19.

4.5.3 Services that support the distribution service

4.5.3.1 General

The primary purpose of a MAC sublayer is to transfer MSDUs between MAC sublayer entities. The information required for the distribution service to operate is provided by the association services. Before a data message can be handled by the distribution service, a STA is “associated.”

To understand the concept of association, it is necessary first to understand the concept of mobility.

4.5.3.2 Mobility types

The three transition types of significance to this standard that describe the mobility of STAs within a network are as follows:

a) No-transition: In this type, two subclasses that are usually indistinguishable are identified:
   1) Static—no motion.
   2) Local movement—movement within the PHY range of the communicating STAs, i.e., movement within a basic service area (BSA).

b) BSS-transition: This type is defined as a STA movement from one BSS in one ESS to another BSS within the same ESS. A fast BSS transition is a BSS transition that establishes the state necessary for data connectivity before the reassociation rather than after the reassociation.

c) ESS-transition: This type is defined as STA movement from a BSS in one ESS to a BSS in a different ESS. This case is supported only in the sense that the STA may move. Maintenance of upper-layer connections cannot be guaranteed by IEEE Std 802.11; in fact, disruption of service is likely to occur.

The FT Protocol provides a mechanism for a STA to perform a BSS transition between access points (APs) in a robust security network (RSN) or when quality-of-service (QoS) admission control is enabled in the ESS.

The different association services support the different categories of mobility.

4.5.3.3 Association

To deliver a message within a DS, the distribution service needs to know which AP to access for the given IEEE 802.11 STA. This information is provided to the DS by the concept of association. Association is necessary, but not sufficient, to support BSS-transition mobility. Association is sufficient to support no-transition mobility. Association is one of the services in the DSS.

Before a STA is allowed to send a data message via an AP, it first becomes associated with the AP. The act of becoming associated invokes the association service, which provides the STA to AP mapping to the DS. The DS uses this information to accomplish its message distribution service. How the information provided by the association service is stored and managed within the DS is not specified by this standard.
Within a robust security network (RSN), association is handled differently. In an RSNA, the IEEE 802.1X Port determines when to allow data traffic across an IEEE 802.11 link. A single IEEE 802.1X Port maps to one association, and each association maps to an IEEE 802.1X Port. An IEEE 802.1X Port consists of an IEEE 802.1X Controlled Port and an IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. Once the AKM completes successfully, data protection is enabled to prevent unauthorized access, and the IEEE 802.1X Controlled Port unblocks to allow protected data traffic. IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. It is expected that most other protocol exchanges will make use of the IEEE 802.1X Controlled Ports. However, a given protocol might need to bypass the authorization function and make use of the IEEE 802.1X Uncontrolled Port.

NOTE—See IEEE Std 802.1X-2004 for a discussion of Controlled Port and Uncontrolled Port.

At any given instant, a STA is associated with no more than one AP. This allows the DS to determine a unique answer to the question, “Which AP is serving STA X?” Once an association is completed, a STA may make full use of a DS (via the AP) to communicate. Association is always initiated by the mobile STA, not the AP.

An AP may be associated with many STAs at one time.

A STA learns what APs are present and what operational capabilities are available from each of those APs and then invokes the association service to establish an association. For details of how a STA learns about what APs are present, see 10.1.4.

4.5.3.4 Reassociation

Association is sufficient for no-transition message delivery between IEEE 802.11 STAs. Additional functionality is needed to support BSS-transition mobility. The additional required functionality is provided by the reassociation service. Reassociation is one of the services in the DSS.

The reassociation service is invoked to “move” a current association from one AP to another. This keeps the DS informed of the current mapping between AP and STA as the STA moves from BSS to BSS within an ESS. Reassociation also enables changing association attributes of an established association while the STA remains associated with the same AP. Reassociation is always initiated by the mobile STA.

No facilities are provided to move an RSNA during reassociation. Therefore, the old RSNA is deleted, and a new RSNA is constructed.

4.5.3.5 Disassociation

The disassociation service is invoked when an existing association is to be terminated. Disassociation is one of the services in the DSS.

In an ESS, this tells the DS to void existing association information. Attempts to send messages via the DS to a disassociated STA will be unsuccessful.

The disassociation service may be invoked by either party to an association (non-AP STA or AP). Disassociation is a notification, not a request. Disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

APs may disassociate STAs to enable the AP to be removed from a network for service or for other reasons.
STAs attempt to disassociate when they leave a network. However, the MAC protocol does not depend on STAs invoking the disassociation service. (MAC management is designed to accommodate loss of communication with an associated STA.)

4.5.4 Access control and data confidentiality services

4.5.4.1 General

Two services are required for IEEE Std 802.11 to provide functionality equivalent to that which is inherent to wired LANs. The design of wired LANs assumes the physical attributes of wire. In particular, wired LAN design assumes the physically closed and controlled nature of wired media. The physically open medium nature of an IEEE 802.11 LAN violates those assumptions.

In a WLAN that does not support RSNA, two services, authentication and data confidentiality, are defined. IEEE 802.11 authentication is used instead of the wired media physical connection. WEP encryption was defined to provide the data confidentiality aspects of closed wired media.

An RSNA uses the IEEE 802.1X authentication service along with enhanced data cryptographic encapsulation mechanisms, such as TKIP and CCMP to provide access control. The IEEE 802.11 station management entity (SME) provides key management via an exchange of IEEE 802.1X EAPOL-Key frames. Data confidentiality and data integrity are provided by RSN key management together with the enhanced data cryptographic encapsulation mechanisms.

4.5.4.2 Authentication

IEEE 802.11 authentication operates at the link level between IEEE 802.11 STAs. IEEE Std 802.11 does not provide either end-to-end (message origin to message destination) or user-to-user authentication.

IEEE Std 802.11 attempts to control LAN access via the authentication service. IEEE 802.11 authentication is an SS. This service may be used by all STAs to establish their identity to STAs with which they communicate, in both ESS and IBSS networks. If a mutually acceptable level of authentication has not been established between two STAs, an association is not established.

IEEE Std 802.11 defines four 802.11 authentication methods: Open System authentication, Shared Key authentication, FT authentication, and simultaneous authentication of equals (SAE). Open System authentication admits any STA to the DS. Shared Key authentication relies on WEP to demonstrate knowledge of a WEP encryption key. FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations as defined in Clause 12. SAE authentication uses finite field cryptography to prove knowledge of a shared password. The IEEE 802.11 authentication mechanism also allows definition of new authentication methods.

An RSNA might support SAE authentication. An RSNA also supports authentication based on IEEE Std 802.1X-2004, or preshared keys (PSKs) after Open System authentication. IEEE 802.1X authentication utilizes the EAP to authenticate STAs and the AS with one another. This standard does not specify an EAP method that is mandatory to implement. See 11.5.5 for a description of the IEEE 802.1X authentication and PSK usage within an IEEE 802.11 IBSS.

In an RSNA, IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port.
SAE authentication or Open System 802.11 authentication is used in an RSN for infrastructure BSS. SAE authentication, Open System 802.11 authentication, or no 802.11 authentication is used in an RSN for IBSS. SAE authentication is used in an MBSS. An RSNA disallows the use of Shared Key 802.11 authentication.

A STA may be authenticated with many other STAs at any given instant.

Because the IEEE 802.1X authentication process could be time-consuming (depending on the authentication protocol in use), the authentication service can be invoked independently of the association service.

This type of preauthentication is typically done by a STA while it is already associated with an AP (with which it previously authenticated). IEEE Std 802.11 does not require that STAs preauthenticate with APs. However, authentication is required before an association establishment is complete.

If the authentication is left until reassociation time, this might impact the speed with which a STA reassociates between APs, limiting BSS-transition mobility performance. The use of preauthentication takes the authentication service overhead out of the time-critical reassociation process.

SAE authentication is performed prior to association and a STA can take advantage of the fact that it can be IEEE 802.11 authenticated to many APs simultaneously by completing the SAE protocol with any number of APs while still being associated to another AP. RSNA security can be established after association using the resulting shared key.

4.5.4.3 Deauthentication

The deauthentication service is invoked when an existing Open System, Shared Key, or SAE authentication is to be terminated. Deauthentication is an SS.

When the deauthentication service is terminating SAE authentication any PTKSA, GTKSA, mesh TKSA, or mesh GTKSA related to this SAE authentication is destroyed. If PMK caching is not enabled, deauthentication also destroys any PMKSA created as a result of this successful SAE authentication.

In an ESS, because authentication is a prerequisite for association, the act of deauthentication causes the STA to be disassociated. The deauthentication service may be invoked by either authenticated party (non-AP STA or AP). Deauthentication is not a request; it is a notification. The association at the transmitting STA is terminated when the STA sends a deauthentication notice to an associated STA. Deauthentication, and if associated, disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

In an RSN ESS, Open System 802.11 authentication is required. In an RSN ESS, deauthentication results in termination of any association for the deauthenticated STA. It also results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the pairwise transient key security association (PTKSA). The deauthentication notification is provided to IEEE Std 802.1X-2004 via the MAC layer.

In an RSNA, deauthentication also destroys any related pairwise transient key security association (PTKSA), group temporal key security association (GTKSA), station-to-station link (STSL) master key security association (SMKSA), STSL transient key security association (STKSA), and integrity group temporal key security association (IGTKSA) that exist in the STA and closes the associated IEEE 802.1X Controlled Port. If pairwise master key (PMK) caching is not enabled, deauthentication also destroys the pairwise master key security association (PMKSA) from which the deleted PTKSA was derived.

In an RSN IBSS, Open System authentication is optional, but a STA is required to recognize Deauthentication frames. Deauthentication results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the PTKSA.
4.5.4.4 Data confidentiality

In a wired LAN, only those STAs physically connected to the wire can send or receive LAN traffic. With a wireless shared medium, there is no physical connection, and all STAs and certain other RF devices in or near the LAN might be able to send, receive, and/or interfere with the LAN traffic. An IEEE 802.11-compliant STA can receive like-PHY IEEE 802.11 traffic that is within range and can transmit to any other IEEE 802.11 STA within range. Thus, the connection of a single wireless link (without data confidentiality) to an existing wired LAN may seriously degrade the security level of the wired LAN.

To bring the security of the WLAN up to the level implicit in wired LAN design, IEEE Std 802.11 provides the ability to protect the contents of messages. This functionality is provided by the data confidentiality service. Data confidentiality is an SS.

IEEE Std 802.11 provides several cryptographic algorithms to protect data traffic, including: WEP, TKIP, and CCMP. WEP and TKIP are based on the ARC4 algorithm, and CCMP is based on the advanced encryption standard (AES). A means is provided for STAs to select the algorithm(s) to be used for a given association.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed robust management frames. This standard does not provide data confidentiality for group addressed robust management frames.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed and group addressed data frames between mesh STAs.

The default data confidentiality state for all IEEE 802.11 STAs is “in the clear,” i.e., without protection. If the data confidentiality service is not invoked, all frames are sent unprotected. If this policy is unacceptable to the sender, it does not send data frames; and if the policy is unacceptable to the receiver, it discards any received data frames. Unprotected data frames and unprotected robust management frames received at a STA configured for mandatory data confidentiality, as well as protected data frames and protected robust management frames using a key not available at the receiving STA, are discarded without an indication to LLC (or without indication to distribution services in the case of “To DS” frames received at an AP). These frames are acknowledged on the WM [if received without frame check sequence (FCS) error] to avoid wasting WM bandwidth on retries of frames that are being discarded.

4.5.4.5 Key management

The enhanced data confidentiality, data authentication, and replay protection mechanisms require fresh cryptographic keys and corresponding security associations. The procedures defined in this standard provide fresh keys by means of protocols called the 4-Way Handshake, FT 4-Way Handshake, FT Protocol, FT Resource Request Protocol, and Group Key Handshake.

4.5.4.6 Data origin authenticity

The data origin authenticity mechanism defines a means by which a STA that receives a data or protected Robust Management frame can determine which STA transmitted the MAC protocol data unit (MPDU). This feature is required in an RSNA to prevent one STA from masquerading as a different STA.

---

19Details of the ARC4 algorithm are available from RSA Security, Inc. Contact RSA Security, 174 Middlesex Turnpike, Bedford, MA 01730 (http://www.rsasecurity.com/), for algorithm details and the uniform ARC4 license terms that RSA offers to anyone wishing to use ARC4 for the purpose of implementing the IEEE 802.11 WEP option. If necessary, contact the IEEE Standards Department Intellectual Property Rights Administrator for details on how to communicate with RSA.
Data origin authenticity is only applicable to individually addressed data frames, and individually addressed robust management frames. The protocols do not guarantee data origin authenticity for group addressed frames, as this cannot be accomplished using symmetric keys and public key methods are too computationally expensive.

4.5.4.7 Replay detection

The replay detection mechanism defines a means by which a STA that receives a data or protected Robust Management frame from another STA can detect whether the received frame is an unauthorized retransmission. This replay protection mechanism is provided for data frames for STAs that use enhanced data cryptographic encapsulation mechanisms. The replay protection mechanism is also provided for robust management frames for STAs that use CCMP and Broadcast/Multicast Integrity Protocol (BIP).

4.5.4.8 Fast BSS transition

The FT mechanism defines a means for a STA to set up security and QoS parameters prior to reassociation to a new AP. This mechanism allows time-consuming operations to be removed from the time-critical reassociation process.

4.5.4.9 Robust management frame protection

Robust management frames are a set of management frames that can be protected by the management frame protection service. The robust management frames are Disassociation, Deauthentication, and robust Action frames. Action frames specified with “No” in the “Robust” column of Table 8-38 are not robust management frames and are not protected.

Management frame protection protocols in an infrastructure BSS or IBSS apply to robust management frames after RSNA PTK establishment for protection of individually addressed frames is completed and after delivery of the IGTK to protect group addressed frames. Robust management frame protection is implemented by CCMP, BIP, and the SA Query procedure.

Management frame protection protocols in an MBSS apply to individually addressed frames after establishment of the RSNA MTK, and to group addressed frames indicated as "Group Addressed Privacy" in Table 8-38. Robust management frame protection is implemented by CCMP.

4.5.5 Spectrum management services

4.5.5.1 General

Two services are required to satisfy requirements in some regulatory domains (see Annex D and Annex E) for operation in the 5 GHz band. These services are called transmit power control (TPC) and dynamic frequency selection (DFS).

4.5.5.2 TPC

Radio regulations may require radio local area networks (RLANs) operating in the 5 GHz band to use transmitter power control, involving specification of a regulatory maximum transmit power and a mitigation requirement for each allowed channel, to reduce interference with satellite services. The TPC service is used to satisfy this regulatory requirement.
The TPC service provides for the following:
- Association of STAs with an AP in a BSS based on the STAs’ power capability.
- Specification of regulatory and local maximum transmit power levels for the current channel.
- Selection of a transmit power for each transmission in a channel within constraints imposed by regulatory requirements.
- Adaptation of transmit power based on a range of information, including path loss and link margin estimates.

4.5.5.3 DFS

Radio regulations might require RLANs operating in the 5 GHz band to implement a mechanism to avoid co-channel operation with radar systems and to provide uniform utilization of available channels. The DFS service is used to satisfy these regulatory requirements.

The DFS service provides for the following:
- Association of STAs with an AP in a BSS based on the STAs’ supported channels.
- Quieting the current channel so it can be tested for the presence of radar with less interference from other STAs.
- Testing channels for radar before using a channel and while operating in a channel.
- Discontinuing operations after detecting radar in the current channel to avoid interference with radar.
- Detecting radar in the current and other channels based on regulatory requirements.
- Requesting and reporting of measurements in the current and other channels.
- Selecting and advertising a new channel to assist the migration of a BSS after radar is detected.

4.5.6 Traffic differentiation and QoS support

IEEE Std 802.11 uses a shared medium and provides differentiated control of access to the medium to handle data transfers with QoS requirements. The QoS facility (per MSDU traffic category and TSPEC negotiation) allows an IEEE 802.11 LAN to become part of a larger network providing end-to-end QoS delivery or to function as an independent network providing transport on a per-link basis with specified QoS commitments. The specifications regarding the integration and operability of the QoS facility in IEEE 802.11 specification with any other end-to-end QoS delivery mechanism like Resource Reservation Protocol (RSVP) are beyond the scope of this standard.

4.5.7 Support for higher layer timer synchronization

Some applications, e.g., the transport and rendering of audio or video streams, require synchronized timers shared among different STAs. Greater accuracy (in terms of jitter bounds) or finer timer granularity than that provided by a BSS timing synchronization function (TSF) may be an additional requirement. In support of such applications, this standard defines a MAC service that enables layers above the MAC to accurately synchronize application-dependent timers shared among STAs. The service is usable by more than one application at a time.
Although the timer synchronization methods and accuracy requirements are application-dependent and are beyond the scope of this standard, they rely on an indication from each MAC that is provided essentially simultaneously, via group addressed transmissions, to the STAs. The MAC accomplishes this by indicating the occurrence of the end of the last symbol of particular data frames; the data frames of interest are identified by their MAC header Address 1 field when it contains a group address previously registered with the MAC. The last symbol is observed on the air by STAs within a BSS while the delay between the observation and the delivery of the indication is known within a MAC by design (and communicated to the application by implementation-dependent means). The common reference point in time provided by the end of last symbol indication is the essential building block upon which a variety of application-dependent timer synchronization methods may be based.

### 4.5.8 Radio Measurement service

The Radio Measurement service provides the following:

- The ability to request and report radio measurements in supported channels.
- The ability to perform radio measurements in supported channels.
- An interface for upper layer applications to retrieve radio measurements using MLME primitives and/or MIB access.
- Information about neighbor APs.

### 4.5.9 Interworking with external networks

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA may have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
  - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via management frames
  - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., Access Network Query Protocol (ANQP) or an IEEE 802.21 Information Server) in the BSS or in an external network reachable via the BSS.
  - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Emergency services
  - Emergency Call and Network Alert support at the link level
- QoS Map distribution
- SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 4.11, provides both support for a STA’s network selection and a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 10.24.6) and identifying that a traffic stream is used for emergency services.

---

20The synchronization indication (observed time) within the BSS varies slightly due to propagation.
The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network may have its own layer-3 end-to-end packet marking practice (e.g., differentiated services code point (DSCP) usage conventions), a means to remap the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

### 4.6 Multiple logical address spaces

Just as the IEEE 802.11 architecture allows for the possibility that the WM, DSM, and an integrated wired LAN may all be different physical media, it also allows for the possibility that each of these components may be operating within different address spaces. IEEE Std 802.11 only uses and specifies the use of the WM address space.

Each IEEE 802.11 PHY operates in a single medium—the WM. The IEEE 802.11 MAC operates in a single address space. MAC addresses are used on the WM in the IEEE 802.11 architecture. Therefore, it is unnecessary for the standard to explicitly specify that its addresses are “WM addresses.” This is assumed throughout this standard.

IEEE Std 802.11 has chosen to use the IEEE 802 48-bit address space (see 8.2.4.3.2). Thus IEEE 802.11 addresses are compatible with the address space used by the IEEE 802 LAN family.

The IEEE 802.11 choice of address space implies that for many instantiations of the IEEE 802.11 architecture, the wired LAN MAC address space and the IEEE 802.11 MAC address space may be the same. In those situations where a DS that uses MAC level IEEE 802 addressing is appropriate, all three of the logical address spaces used within a system could be identical. While this is a common case, it is not the only combination allowed by the architecture. The IEEE 802.11 architecture allows for all three logical address spaces to be distinct.

A multiple address space example is one in which the DS implementation uses network layer addressing. In this case, the WM address space and the DS address space would be different.

Note that IEEE 802.11 STAs within a single ESS share the same address space, fulfilling the transparency requirement from the definition of the DS. The DSS uses this same address space, even in the case where the DSM uses a different address space.

The ability of the architecture to handle multiple logical media and address spaces is key to the ability of IEEE Std 802.11 to be independent of the DS implementation and to interface cleanly with network layer mobility approaches. The implementation of the DS is unspecified and is beyond the scope of this standard.

### 4.7 Differences between ESS and IBSS LANs

In 4.3.2 the concept of the IBSS LAN was introduced. In an IBSS network, a STA communicates directly with one or more other STAs.
Consider the full IEEE 802.11 architecture as shown in Figure 4-12.

![Figure 4-12—IEEE 802.11 architecture (again)](image)

An IBSS consists of STAs that are directly connected. Thus there is (by definition) only one BSS. Further, because there is no physical DS, there is no portal, integrated wired LAN, or DSS. The logical picture reduces to Figure 4-13.

![Figure 4-13—Logical architecture of an IBSS](image)

Only the minimum two STAs are shown in Figure 4-13. An IBSS may have an arbitrary number of members. In an IBSS only Class 1 and Class 2 frames are allowed because there is no DS in an IBSS.

The services that apply to an IBSS are the SSs. A QoS IBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. The parameters that control differentiation of the delivery of MSDUs with different priority using EDCA are fixed. A QoS IBSS has no HC and does not support polled TXOP operation and setting up of TSPEC.

In an IBSS each STA enforces its own security policy. In an ESS, an AP can enforce a uniform security policy across all STAs.
4.8 Differences between ESS and MBSS LANs

In 4.3.15, the concept of the MBSS LAN was introduced. It was noted that using the multi-hop capability it appears as if all mesh STAs are directly connected at the MAC layer even if the STAs are not within range of each other. This is different from an IBSS network, where STAs cannot communicate if they are not within range of each other.

Unlike the IBSS, an MBSS might have access to the DS. An MBSS connects through one or more mesh gates to the DS. Since in an MBSS it appears as if all mesh STAs are directly connected at the MAC layer, the MBSS can be used as a DSM. APs, portals, and mesh gates might use the MBSS as a DSM to provide the DSS. Thus, different infrastructure BSSs can unite over the MBSS to form an ESS for example.

An AP identifies the infrastructure BSS that it forms. This is different from the MBSS where no such central entity exists. Whereas infrastructure BSSs need the ESS and thus the DS to unite, the MBSS network appears the same to an LLC layer without the need for access to a DS. However, if an MBSS has one or more mesh gates providing access to the DS, the MBSS might exist in disjointed areas and yet form a single network.

4.9 Reference model

4.9.1 General

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1: 1994). The layers and sublayers described in this standard are shown in Figure 4-14.

There is an interface between the IEEE 802.1X Supplicant/Authenticator and the SME not shown in Figure 4-14. This interface is described in IEEE Std 802.1X-2004.
4.9.2 Interworking reference model

The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers.

Interworking functions may require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF may synthesize indications to higher layer entities.

Figure 4-15 shows an entity, the MSGCF, defined in 6.4, that has access to all management information through exposure to the MAC and PHY Sublayer Management Entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media-independent handover (MIH) interface, as defined in IEEE 802.21-2008.

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 4-16 illustrates the concept of an ESS Link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 4-16, STA3 is associated with either AP1 or AP2. The state of the ESS Link is up when STA3 is associated with any of the APs comprising an ESS.
4.10 IEEE Std 802.11 and IEEE Std 802.1X-2004

4.10.1 General

An RSNA relies on IEEE Std 802.1X-2004 to provide authentication services and uses the IEEE 802.11 key management scheme defined in 11.6. The IEEE 802.1X access control mechanisms apply to the association between a STA and an AP and to the relationship between the IBSS STA and STA peer. The AP’s SME performs the Authenticator and, optionally, the Supplicant and AS roles. In an ESS, a non-AP STA’s SME performs the Supplicant role. In an IBSS the SME takes on both the Supplicant and Authenticator roles and may take on the AS role.

4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2004

IEEE Std 802.11 depends upon IEEE Std 802.1X-2004 to control the flow of MAC service data units (MSDUs) between the DS and STAs by use of the IEEE 802.1X Controlled/Uncontrolled Port model. IEEE 802.1X authentication frames are transmitted in IEEE 802.11 data frames and passed via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. It is the responsibility of both the Supplicant and the Authenticator to implement port blocking. Each association between a pair of STAs creates a unique pair of IEEE 802.1X Ports, and authentication takes place relative to those ports alone.

IEEE Std 802.11 depends upon IEEE Std 802.1X-2004 and the 4-Way Handshake, FT 4-Way Handshake, FT Protocol, FT Resource Request Protocol, and Group Key Handshake, described in Clause 11 and Clause 12, to establish and change cryptographic keys. Keys are established after authentication has completed. Keys may change for a variety of reasons, including expiration of an IEEE 802.1X authentication timer, key compromise, danger of compromise, or policy.
4.10.3 Infrastructure functional model overview

4.10.3.1 General

This subclause summarizes the system setup and operation of an RSN, in three cases: when a password or PSK is used during IEEE 802.11 authentication, when an IEEE 802.1X AS is used after Open System authentication, and when a PSK is used after Open System authentication. For an ESS, the AP includes an Authenticator, and each associated STA includes a Supplicant.

4.10.3.2 AKM operations with AS

The following AKM operations are carried out when an IEEE 802.1X AS is used:

a) Prior to any use of IEEE Std 802.1X-2004, IEEE Std 802.11 assumes that the Authenticator and AS have established a secure channel. The security of the channel between the Authenticator and the AS is outside the scope of this standard.

Authentication credentials are distributed to the Supplicant and AS prior to association.

b) A STA discovers the AP’s security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-17). If IEEE 802.1X authentication is used, the EAP authentication process starts when the Authenticator sends the EAP-Request (shown in Figure 4-18) or the Supplicant sends the EAPOL-Start message. EAP authentication frames pass between the Supplicant and AS via the Authenticator and Supplicant’s Uncontrolled Ports. This is shown in Figure 4-18.
c) The Supplicant and AS authenticate each other and generate a PMK. The PMK is sent from the AS to the Authenticator over the secure channel. See Figure 4-18.

![Figure 4-18—IEEE 802.1X EAP authentication](image)

A 4-Way Handshake or FT 4-Way Handshake utilizing EAPOL-Key frames is initiated by the Authenticator to do the following:

- Confirm that a live peer holds the PMK.
- Confirm that the PMK is current.
- In the case of fast BSS transition, derive PMK-R0s and PMK-R1s.
- Derive a fresh pairwise transient key (PTK) from the PMK or, in the case of fast BSS transition, from the PMK-R1.
- Install the pairwise encryption and integrity keys into IEEE Std 802.11.
- Transport the group temporal key (GTK) and GTK sequence number from Authenticator to Supplicant and install the GTK and GTK sequence number in the STA and, if not already installed, in the AP.
- If management frame protection is negotiated, transport the IGTK and the IGTK packet number (IPN) from the Authenticator to the Supplicant and install these values in the STA and, if not already installed, in the AP.
- Verify that the RSN capabilities negotiated are valid as defined in 8.4.2.27.4.
- Confirm the cipher suite selection.

Installing the PTK, and where applicable the GTK keys, causes the MAC to encrypt and decrypt all subsequent MSDUs irrespective of their path through the controlled or uncontrolled ports.

Upon successful completion of the 4-Way Handshake, the Authenticator and Supplicant have authenticated each other; and the IEEE 802.1X Controlled Ports are unblocked to permit general data traffic. See Figure 4-19.
If the Authenticator later changes the GTK, it sends the new GTK and GTK sequence number to the Supplicant using the Group Key Handshake to allow the Supplicant to continue to receive group addressed messages and, optionally, to transmit and receive individually addressed frames. EAPOL-Key frames are used to carry out this exchange. See Figure 4-20.

When management frame protection is negotiated, the Authenticator also uses the Group Key Handshake with all associated STAs to change the IGTK. The Authenticator encrypts the GTK and IGTK values in the EAPOL-Key frame as described in 11.6.

4.10.3.3 AKM Operations with a Password or PSK

The following AKM operations are carried out when authentication is accomplished using a Password or PSK:

- A STA discovers the AP’s security policy through passively monitoring the Beacon frames or through active probing. After discovery the STA performs SAE authentication using IEEE 802.11 Authentication frames with the AP (see Figure 4-21).
- Upon the successful conclusion of SAE, both the STA and AP generate a PMK. The STA then associates to an AP and negotiate security policy. The AKM confirmed in the Association Request and Response is the AKM of SAE or Fast BSS Transition.
- The PMK generated by SAE is used in a 4-Way Handshake using EAPOL-Key frames, just as with IEEE 802.1X authentication when an AS is present. See Figure 4-19.
The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.

### 4.10.3.4 Alternate operations with PSK

The following AKM operations represent an alternate operation of using a PSK. This operation has security vulnerabilities when used with a low-entropy key and is recommended to be used only after taking that into account. When this operation is carried out, the PMK is a PSK:

- A STA discovers the AP’s security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-17). A STA associates with an AP and negotiates a security policy. The PMK is the PSK.
The 4-Way Handshake using EAPOL-Key frames is used, just as with IEEE 802.1X authentication, when an AS is present. See Figure 4-19.

The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.

If management frame protection is negotiated, the IGTK and IGTK packet number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.

### 4.10.3.5 Disassociation

Disassociation initiated by either STA in an RSNA causes the deletion of the PTKSA at both ends and the deletion of the GTKSA in a non-AP STA. The controlled and uncontrolled ports created for this association are also deleted.

### 4.10.4 IBSS functional model description

#### 4.10.4.1 General

This subclause summarizes the system setup and operation of an RSNA in an IBSS. An IBSS RSNA is specified in 11.5.10.

#### 4.10.4.2 Key usage

In an IBSS the individually addressed data frames between two STAs are protected with a pairwise key. The key is part of the PTK, which is derived during a 4-Way Handshake. In an IBSS the 4-Way Handshake may follow IEEE 802.11 authentication of one STA to another. Such authentication may be used by the peer to cause deletion of the PTKSA and Block the Controlled Port thus resetting any previous handshake.

In an IBSS group addressed data frames are protected by a key, e.g., named B1, that is generated by the STA transmitting the group addressed frame. To allow other STAs to decrypt group addressed frames, B1 is sent to all the other STAs in the IBSS. B1 is sent in an EAPOL-Key frame, encrypted under the EAPOL-Key encryption key (KEK) portion of the PTK, and protected from modification by the EAPOL-Key confirmation key (KCK) portion of the PTK.

In an IBSS the SME responds to Deauthentication frames from a STA by deleting the PTKSA associated with that STA.

#### 4.10.4.3 Sample IBSS 4-Way Handshakes

In this example (see Figure 4-22), there are three STAs: S1, S2, S3. The group addressed frames sent by S1 are protected by B1; similarly B2 for S2, and B3 for S3.

For STAs S2 and S3 to decrypt group addressed frames from S1, B1 is sent to S2 and S3. This is done using the 4-Way Handshake initially and using the Group Key Handshake for GTK updates.

The 4-Way Handshake from S1 to S2 allows S1 to send group addressed frames to S2, but does not allow S2 to send group addressed frames to S1 because S2 has a different transmit GTK. Therefore, S2 needs to initiate a 4-Way Handshake to S1 to allow S1 to decrypt S2’s group addressed frames. Similarly, S2 also needs to initiate a 4-Way Handshake to S3 to enable S3 to receive group addressed messages from S2.

In a similar manner S3 needs to complete the 4-Way Handshake with S1 and S2 to deliver B3 to S1 and S2.

In this example, there are six 4-Way Handshakes. In general, $N$ Supplicants require $N(N-1)$ 4-Way Handshakes.
NOTE—In principle the KCK and KEK from a single 4-Way Handshake can be used for the Group Key Handshake in both directions, but using two 4-Way Handshakes means the Authenticator key state machine does not need to be different between IBSS and ESS.

The Group Key Handshake can be used to send the GTKs to the correct STAs. The 4-Way Handshake is used to derive the pairwise key and to send the initial GTK. Because in an IBSS there are two 4-Way Handshakes between any two Supplicants and Authenticators, the pairwise key used between any two STAs is from the 4-Way Handshake initiated by the STA Authenticator with the higher MAC address (see 11.6.1 for the notion of address comparison). The KCK and KEK used for a Group Key Handshake are the KCK and KEK derived by the 4-Way Handshake initiated by the same Authenticator that is initiating the Group Key Handshake.

In an IBSS a secure link exists between two STAs when both 4-Way Handshakes have completed successfully. The Supplicant and Authenticator 4-Way Handshake state machines interact so the IEEE 802.1X variable portValid is not set to 1 until both 4-Way Handshakes complete.

If a fourth STA comes within range and its SME decides to initiate a security association with the three peers, its Authenticator initiates 4-Way Handshakes with each of the other three Supplicants. Similarly, the original three STA Authenticators in the IBSS need to initiate 4-Way Handshakes to the fourth STA Supplicant. A STA learns that a peer STA is RSNA-enabled and the peer’s security policy (e.g., whether the Authentication and Key Management Protocol (AKMP) is SAE, PSK, or IEEE 802.1X authentication) from the Beacon or Probe Response frame. The initiation might start for a number of reasons:

a) The fourth STA receives a Beacon or Probe Response frame from a MAC address with which it has not completed a 4-Way Handshake.

b) An SME receives a MLME-PROTECTEDFRAMEDROPPED.indication primitive from a MAC address with which it has not completed a 4-Way Handshake. This could be a group addressed data frame transmitted by any of the STAs. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

c) An SME receives Message 1 of the 4-Way Handshake sent to a STA because the initiator received a broadcast data frame, Beacon frame, or Probe Response frame from that STA. In order to set up a security association to the peer STA, a STA that received a 4-Way Handshake but does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.
4.10.4.4 IBSS IEEE 802.1X example

When IEEE 802.1X authentication is used, each STA needs to include an IEEE 802.1X Authenticator and AS. A STA learns that a peer STA is RSNA-enabled and the peer’s security policy (e.g., whether the AKMP is PSK or IEEE 802.1X authentication) from the Beacon or Probe Response frame.

Each Supplicant sends an EAPOL-Start message to every other STA to which it intends to authenticate, and each STA’s Authenticator responds with the identity of the credential it intends to use.

The EAPOL-Start and EAP-Request/Identity messages are initiated when a protected data frame (indicated via a MLME-PROTECTEDFRAMEDROPPED.indication primitive), an IEEE 802.1X message, Beacon frame, or Probe Response frame is received from a MAC address with which the STA has not completed IEEE 802.1X authentication. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

Although Figure 4-23 shows the two IEEE 802.1X exchanges serialized, they may occur interleaved.

![Figure 4-23—Example using IEEE 802.1X authentication](image)

4.10.5 Authenticator-to-AS protocol

The Authenticator-to-AS authentication definition is out of the scope of this standard, but, to provide security assurances, the protocol needs to support the following functions:

a) Mutual authentication between the Authenticator and AS
b) A channel for the Supplicant/AS authentication

c) The ability to pass the generated key from the AS to the Authenticator in a manner that provides authentication of the key source, preserves integrity of the key transfer, and preserves data confidentiality of the key from all other parties

Suitable protocols include, but are not limited to, remote authentication dial-in user service (RADIUS) (IETF RFC 2865-2000 [B31]) and Diameter (IETF RFC 3588-2003 [B36]).

4.10.6 PMKSA caching

The Authenticator and Supplicant may cache PMKSAs, which include the IEEE 802.1X state. A PMKSA can be deleted from the cache for any reason and at any time.

The STA may supply a list of PMK or PSK key identifiers in the (Re)Association Request frame. Each key identifier names a PMKSA; the PMKSA may contain a single PMK. The Authenticator specifies the selected PMK or PSK key identifier in Message 1 of the 4-Way Handshake. The selection of the key identifiers to be included within the (Re)Association Request frame and Message 1 of the 4-Way Handshake is out of the scope of this standard.

4.10.7 Protection of group addressed robust management frames

When management frame protection is negotiated, all group addressed robust management frames are encapsulated using the procedures defined in 10.13. This service provides integrity protection of group addressed robust management frames using BIP.

4.11 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate with the wireless LAN. The exchange of information may also be performed after associating to the BSS.

In an IBSS GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS.

There are a number of reasons why providing information to a STA in a preassociated state is beneficial:

— It supports more informed decision making about an IEEE 802.11 infrastructure with which to associate. This is generally more efficient than requiring a non-AP STA to associate with an AP before discovering the information and then deciding whether to stay associated.

— It is possible for the non-AP STA to query multiple networks in parallel.

— The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.
5. MAC service definition

5.1 Overview of MAC services

5.1.1 Data service

5.1.1.1 General

This service provides peer LLC entities with the ability to exchange MSDUs. To support this service, the local MAC uses the underlying PHY-level services to transport an MSDU to a peer MAC entity, where it is delivered to the peer LLC. Such asynchronous MSDU transport is performed on a connectionless basis. By default, MSDU transport is on a best-effort basis. However, the QoS facility uses a traffic identifier (TID) to specify differentiated services on a per-MSDU basis. The QoS facility also permits more synchronous behavior to be supported on a connection-oriented basis using TSPECs. There are no guarantees that the submitted MSDU will be delivered successfully. Group addressed transport is part of the data service provided by the MAC. Due to the characteristics of the WM, group addressed MSDUs may experience a lower QoS, compared to that of individually addressed MSDUs. All STAs support the data service, but only QoS STAs in a QoS BSS differentiate their MSDU delivery according to the designated traffic category or traffic stream (TS) of individual MSDUs.

Because operation of certain functions of the MAC may cause reordering of some MSDUs, as discussed in more detail below, in non-QoS STAs, there are two service classes within the data service. By selecting the desired service class, each LLC entity initiating the transfer of MSDUs is able to control whether MAC entities are or are not allowed to reorder those MSDUs.

There are two service classes available in a QoS STA: QoSAck and QoSNoAck. The service classes are used to signal if the MSDU is to be transmitted with or without using the MAC-level acknowledgment.

In QoS STAs either associated in a BSS or having membership in an IBSS, the MAC uses a set of rules that tends to cause higher UP MSDUs in a BSS to be sent before lower UP MSDUs in the BSS. The MAC sublayer entities determine the UPs for MSDUs based on the TID values provided with those MSDUs. If a TSPEC has been provided for a TS, via the MAC sublayer management entity, the MAC attempts to deliver MSDUs belonging to that TS in accordance with the QoS parameter values contained in the TSPEC. In a BSS with some STAs supporting the QoS facility and others not supporting the QoS facility, in delivering an MSDU to a non-QoS STA, the QoS STA uses the access category (AC) corresponding to the UP of the MSDU.

5.1.1.2 Determination of UP

The QoS facility supports eight priority values, referred to as UPs. The values a UP may take are the integer values from 0 to 7 and are identical to the IEEE 802.1D priority tags. An MSDU with a particular UP is said to belong to a traffic category (TC) with that UP. The UP is provided with each MSDU at the medium access control service access point (MAC_SAP) either directly, in the UP parameter, or indirectly, in a TSPEC designated by the UP parameter.

5.1.1.3 Determination of UP of received frames at the AP sent by other STAs in the BSS

The received individually addressed frames at the AP may be as follows:

a) Non-QoS subtypes, in which case the AP shall assign to them a priority of Contention, if they are received during the contention period (CP), or ContentionFree, if they are received during the contention-free period (CFP).

b) QoS subtypes, in which case the AP shall infer the UP value from the TID in the QoS Control field directly for TID values between 0 and 7. For TID values between 8 and 15 the AP shall extract the
UP value in the UP subfield of the TS Info field in the associated TSPEC or from the UP field in the associated TCLAS (traffic classification) element, as applicable.

QoS APs deliver the UP with the received MSDUs to the DS.

5.1.1.4 Interpretation of priority parameter in MAC service primitives

The value of the priority parameter in the MAC service primitives (see 5.2) may be a noninteger value of either Contention or ContentionFree or may be any integer value in the range 0 to 15.

When the priority parameter has an integer value, it is used in the TID subfields that appear in certain frames that are used to deliver and to control the delivery of QoS data across the WM.

Priority parameter and TID subfield values 0 to 7 are interpreted as UPs for the MSDUs. Outgoing MSDUs with UP values 0 to 7 are handled by MAC entities at STAs in accordance with the UP.

Priority parameter and TID subfield values 8 to 15 specify TIDs that are also TS identifiers (TSIDs) and select the TSPEC for the TS designated by the TID. Outgoing MSDUs with priority parameter values 8 to 15 are handled by MAC entities at STAs in accordance with the UP value determined from the UP subfield as well as other parameter values in the selected TSPEC. When an MSDU arrives with a priority value between 8 and 15 and for which there is no TSPEC defined, then the MSDU shall be sent with priority parameter set to 0.

The noninteger values of the priority parameter are allowed at all non-QoS STAs. The use of priority value of ContentionFree is deprecated at QoS STAs. The integer values of the priority parameter (i.e., TID) are supported only at QoS STAs that are either associated in an infrastructure QoS BSS or members of a QoS IBSS. A range of 0 to 15 is supported by QoS STAs associated in a QoS BSS; whereas a range of 0 to 7 is supported by QoS STAs that are members of a QoS IBSS. If a QoS STA is associated in a non-QoS BSS, the STA is functioning as a non-QoS STA, so the priority value is always Contention or ContentionFree.

At QoS STAs associated in a QoS BSS, MSDUs with a priority of Contention are considered equivalent to MSDUs with TID 0, and those with a priority of ContentionFree are delivered using the contention-free delivery if a point coordinator (PC) is present in the AP. If a PC is not present, MSDUs with a priority of ContentionFree shall be delivered using an UP of 0. At STAs associated in a non-QoS BSS, all MSDUs with an integer priority are considered equivalent to MSDUs with a priority of Contention.

If a STA is associated in a QoS BSS, the MSDUs it receives in QoS data frames are reported with the TID value contained in the MAC header of that frame. The MSDUs such a STA receives in non-QoS data frames are reported to LLC with a priority of Contention, if they are received during the CP, or ContentionFree, if they are received during the CFP.

5.1.1.5 Interpretation of service class parameter in MAC service primitives in a STA

In QoS STAs, the value of the service class parameter in the MAC service primitive (see 5.2) may be a noninteger value of QoSAck or QoSNoAck.

When an MSDU is received from the MAC_SAP and the recipient STA is a QoS STA with the service class set to

- QoSAck, the MSDU is transmitted using a QoS data frame with the Ack Policy subfield in the QoS Control field set to either Normal Ack (normal acknowledgement) or Block Ack.
- QoSNoAck, the MSDU is transmitted using a QoS data frame with the Ack Policy subfield in the QoS Control field set to No Ack (no acknowledgement). If the sender STA is contained within an AP and the frame has a group DA, then the MSDU is buffered for transmission and is also sent to the DS.
When an MSDU is received from the MAC_SAP and the recipient STA is not a QoS STA, the MSDU is transmitted using a non-QoS data frame.

When a QoS data frame is received from another STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSAck, if the frame is a QoS data frame with the Ack Policy subfield in the QoS Control field equal to either Normal Ack or Block Ack.
- QoSNoAck, if the frame is a QoS data frame with the Ack Policy subfield in the QoS Control field equal to No Ack. This service class is also used where the DA parameter is a group address.

When a non-QoS data frame is received from a STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSAck, if the frame is an individually addressed frame and is acknowledged by the STA.
- QoSNoAck, if the frame is a group addressed frame and is not acknowledged by the STA.

Note that the group addressed frames sent by a non-QoS STA are not acknowledged regardless of the value of the service class parameter in the MA-UNITDATA.indication primitive.

5.1.2 Security services

Security services in IEEE Std 802.11 are provided by the authentication service and the CCMP and BIP mechanisms. The scope of the security services provided is limited to station-to-station data and robust management frame transmissions. When CCMP is used, the data confidentiality service is provided for data frames and individually addressed robust management frames. For the purposes of this standard, CCMP is viewed as a logical service located within the MAC sublayer as shown in the reference model, Figure 4-14 (in 4.9). Actual implementations of CCMP are transparent to the LLC and other layers above the MAC sublayer.

The security services provided by CCMP in IEEE Std 802.11 are as follows:

a) Data Confidentiality;
b) Authentication; and
c) Access control in conjunction with layer management.

BIP provides message integrity and access control for group addressed robust management frames.

During the authentication exchange, both parties exchange authentication information as described in Clause 11 and Clause 12.

The MAC sublayer security services provided by CCMP and BIP rely on information from nonlayer-2 management or system entities. Management entities communicate information to CCMP and BIP through a set of MAC sublayer management entity (MLME) interfaces and MIB attributes; in particular, the decision tree for CCMP and BIP defined in 11.8 is driven by MIB attributes.

The use of WEP for confidentiality, authentication, or access control is deprecated. The WEP algorithm is unsuitable for the purposes of this standard.

The use of TKIP is deprecated. The TKIP algorithm is unsuitable for the purposes of this standard.

A STA that has associated with management frame protection enabled shall not use pairwise cipher suite selectors WEP-40, WEP-104, TKIP, or “Use Group cipher suite.”

A mesh STA with dot11MeshSecurityActivated equal to true shall not use the pairwise cipher suite selectors WEP-40, WEP-104, or TKIP.
5.1.3 MSDU ordering

The services provided by the MAC sublayer permit, and may in certain cases require, the reordering of MSDUs.

In a non-QoS STA, the MAC does not intentionally reorder MSDUs except as may be necessary to improve the likelihood of successful delivery based on the current operational (“power management,” FMS, DMS) mode of the designated recipient STA(s). The sole effect of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, is a change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, originating from a single source STA address. If a higher layer protocol using the data service cannot tolerate this possible reordering, the optional StrictlyOrdered service class should be used. MSDUs transferred between any pair of STAs using the StrictlyOrdered service class are not subject to the relative reordering that is possible when the ReorderableGroupAddressed service class is used. However, the desire to receive MSDUs sent using the StrictlyOrdered service class at a STA precludes simultaneous use of the MAC power management facilities at that STA.

In QoS STAs operating in a BSS, there are two service classes, designated as QoSack and QoSNoAck (see 5.1.1.5 for more information). The MSDUs are reordered, not only to improve the likelihood of successful delivery based on the current operational mode of the designated recipient STA(s), but also to honor the priority parameters, specified in the MA-UNITDATA.request primitive, of the individual MSDUs. The effects of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, are:

a) A change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs,

b) The reordering of MSDUs with different TID values, originating from a single source STA address, and

c) The reordering of group addressed MSDUs with the same TID but different service classes.

There shall be no reordering of individually addressed MSDUs with the same TID value and addressed to the same destination.

STAs operating in a non-QoS BSS shall follow the reordering rules as defined for a non-QoS STA.

In order for the MAC to operate properly, the DS needs to meet the requirements of ISO/IEC 15802-1:1995.

Operational restrictions that provide the appropriate ordering of MSDUs are specified in 9.8.

5.1.4 MSDU format

This standard is part of the IEEE 802 family of LAN standards, and as such all MSDUs are LLC PDUs as defined in ISO/IEC 8802-2: 1998. In order to achieve interoperability, implementers are recommended to apply the procedures described in ISO/IEC Technical Report 11802-5:1997(E) (previously known as IEEE Std 802.1H-1997 [B21]), along with a selective translation table (STT) that handles a few specific network protocols, with specific attention to the operations required when passing MSDUs to or from LANs or operating system components that use the Ethernet frame format. Note that such translations may be required in a STA.

5.1.5 MAC data service architecture

The MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 5-1. During transmission, an MSDU goes through some or all of the following processes: MSDU rate limiting, aggregate MSDU (A-MSDU) aggregation, frame delivery deferral during power save mode, sequence number assignment, fragmentation, encryption, integrity protection, frame formatting, and
aggregate MAC protocol data unit (A-MPDU) aggregation. IEEE Std 802.1X-2004 may block the MSDU at the Controlled Port. At some point, the data frames that contain all or part of the MSDU are queued per AC/TS.

During reception, a received data frame goes through processes of possible A-MPDU deaggregation, MPDU header and cyclic redundancy code (CRC) validation, duplicate removal, possible reordering if the Block Ack mechanism is used, decryption, defragmentation, integrity checking, and replay detection. After replay detection (or defragmentation if security is not used), possible A-MSDU deaggregation, and possible MSDU rate limiting, one or more MSDUs are, delivered to the MAC_SAP or to the DS. The IEEE 802.1X Controlled/Uncontrolled Ports discard any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an IEEE 802.1X frame. Frame order enforcement provided by the enhanced data cryptographic encapsulation mechanisms occurs after decryption, but prior to MSDU defragmentation; therefore, defragmentation fails if MPDUs arrive out of order.

Figure 5-1—MAC data plane architecture
5.2 MAC data service specification

5.2.1 General

The IEEE 802.11 MAC supports the following service primitives as defined in ISO/IEC 8802-2: 1998:

- MA-UNITDATA.request
- MA-UNITDATA.indication
- MA-UNITDATA-STATUS.indication

The LLC definitions of the primitives and specific parameter value restrictions imposed by IEEE Std 802.11 are given in 5.2.2 to 5.2.4.

5.2.2 MA-UNITDATA.request

5.2.2.1 Function

This primitive requests a transfer of an MSDU from a local LLC sublayer entity to a single peer LLC sublayer entity, or multiple peer LLC sublayer entities in the case of group addresses.

5.2.2.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.request(
    source address,
    destination address,
    routing information,
    data,
    priority,
    service class
)
```

The source address (SA) parameter specifies an individual MAC sublayer address of the sublayer entity from which the MSDU is being transferred.

The destination address (DA) parameter specifies either an individual or a group MAC sublayer entity address.

The routing information parameter specifies the route desired for the data transfer (a null value indicates source routing is not to be used). For IEEE Std 802.11, the routing information parameter shall be null.

The data parameter specifies the MSDU to be transmitted by the MAC sublayer entity. For IEEE Std 802.11, the length of the MSDU shall be less than or equal to 2304 octets.

The priority parameter specifies the priority desired for the data unit transfer. The allowed values of priority are described in 5.1.1.4.

The service class parameter specifies the service class desired for the data unit transfer. The allowed values of service class are described in 5.1.1.5 and 5.1.3.

5.2.2.3 When generated

This primitive is generated by the LLC sublayer entity when an MSDU is to be transferred to a peer LLC sublayer entity or entities.
5.2.2.4 Effect of receipt

On receipt of this primitive, the MAC sublayer entity determines whether it is able to fulfill the request according to the requested parameters. A request that cannot be fulfilled according to the requested parameters is discarded, and this action is indicated to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive that describes why the MAC was unable to fulfill the request. If the request can be fulfilled according to the requested parameters, the MAC sublayer entity appends all MAC specified fields (including DA, SA, FCS, and all fields that are unique to IEEE Std 802.11), passes the properly formatted frame to the lower layers for transfer to a peer MAC sublayer entity or entities (see 5.1.4), and indicates this action to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive with transmission status set to Successful.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address and a priority of Contention or ContentionFree, the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address for which the priority is an integer in the range of 0 to 7, inclusive, then the AP’s MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP’s MAC sublayer shall retrieve the MIB variables listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

— If the access category is AC_VO, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_VI, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BE, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then
dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the access category is AC_BK, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate-limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address whose priority is an integer in the range of 8 to 15, inclusive, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.3 MA-UNITDATA.indication

5.2.3.1 Function

This primitive defines the transfer of an MSDU from the MAC sublayer entity to the LLC sublayer entity, or entities in the case of group addresses. In the absence of error, the contents of the data parameter are logically complete and unchanged relative to the data parameter in the associated MA-UNITDATA.request primitive.

5.2.3.2 Semantics of the service primitive

The parameters of the primitive are as follows:

MA-UNITDATA.indication(
    source address,
    destination address,
    routing information,
    data,
    reception status,
    priority,
    service class
)

The SA parameter is an individual address as specified by the SA field of the incoming frame.

The DA parameter is either an individual or a group address as specified by the DA field of the incoming frame.

The routing information parameter specifies the route that was used for the data transfer. The MAC sublayer entity shall set this field to null.
The data parameter specifies the MSDU as received by the local MAC entity.

The reception status parameter indicates the success or failure of the received frame for those frames that IEEE Std 802.11 reports via a MA-UNITDATA.indication primitive. This MAC always reports “success” because all failures of reception are discarded without generating MA-UNITDATA.indication primitive.

The priority parameter specifies the receive processing priority that was used for the data unit transfer. The allowed values of priority are described in 5.1.1.4.

The service class parameter specifies the receive service class that was used for the data unit transfer. The allowed values of service class are described in 5.1.1.5 and 5.1.3.

5.2.3.3 When generated

The MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities to indicate the arrival of a frame at the local MAC sublayer entity. Frames are reported only if they are validly formatted at the MAC sublayer, received without error, received with valid (or null) security and integrity information, and their destination address designates the local MAC sublayer entity.

5.2.3.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent on the content of the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame of type data having a group DA, the AP’s MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticast-MSDUCount shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticast-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data and a priority of Contention or ContentionFree, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data, for which the priority is an integer in the range of 0 to 7, inclusive, then the AP’s MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP’s MAC sublayer shall retrieve the MIB variables from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:
If the access category is AC_VO, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.

If the access category is AC_VI, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

If the access category is AC_BE, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

If the access category is AC_BK, then the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNIfaceActivated is true, upon receipt of an individually addressed frame of type data for which the priority is an integer in the range of 8 to 15, inclusive, the AP’s MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.4 MA-UNITDATA-STATUS.indication

5.2.4.1 Function

This primitive has local significance and provides the LLC sublayer with status information for the corresponding preceding MA-UNITDATA.request primitive.
5.2.4.2 Semantics of the service primitive

The parameters of the primitive are as follows:

\[
\text{MA-UNITDATA-STATUS.indication(}
\begin{align*}
&\text{source address,} \\
&\text{destination address,} \\
&\text{transmission status,} \\
&\text{provided priority,} \\
&\text{provided service class}
\end{align*}
\)

The SA parameter is an individual MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The DA parameter is either an individual or group MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The transmission status parameter is used to pass status information back to the local requesting LLC sublayer entity. IEEE Std 802.11 specifies the following values for transmission status:

\begin{enumerate}
\item Successful.
\itemUndeliverable (excessive data length).
\itemUndeliverable (non-null source routing).
\itemUndeliverable: unsupported priority (for priorities other than Contention or ContentionFree at a non-QoS STA; or for priorities other than Contention, ContentionFree, or an integer between and including 0 and 15 at a QoS STA).
\itemUndeliverable: unsupported service class (for service classes other than ReorderableGroupAddressed or StrictlyOrdered for non-QoS STAs and service classes other than QoSACK or QOSNoAck for QoS STAs).
\itemUnavailable priority (for ContentionFree when no PC or HC is available, or an integer between and including 1 and 15 at a STA that is associated in a non-QoS BSS, or an integer between and including 8 and 15 at a STA that is a member of an IBSS, in which case the MSDU is transmitted with a provided priority of Contention).
\itemUndeliverable: unavailable service class (for StrictlyOrdered service when the STA’s power management mode is other than “active” for non-QoS STAs; QoS STAs do not return this value as they do not provide the StrictlyOrdered service).
\itemUndeliverable (no BSS available).
\itemUndeliverable (cannot encrypt with a null key).
\itemAt a STA where dot11RejectUnadmittedTraffic is true, Undeliverable: un-admitted traffic (for a requested priority between and including 0 and 7 at a STA because there is no admitted TS for this priority and admission control is required for the AC).
\itemFor an AP in which dot11SSIDInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
\itemFor an AP in which dot11SSIDInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
\itemFor an AP in which dot11SSIDInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
\end{enumerate}
n) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

o) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuxMaxHCCAHEMMrate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

If the transmission status parameter is Successful, the provided priority parameter specifies the priority used for the associated data unit transfer (Contention, ContentionFree, or an integer between and including 0 and 15); otherwise the provided priority parameter is not present.

If the transmission status parameter is Successful, the provided service class parameter specifies the class of service for the associated data unit transfer; otherwise the provided service class parameter is not present. In non-QoS STAs, the value of this parameter is ReorderableGroupAddressed or StrictlyOrdered. In QoS STAs, it is QoSACK or QoSNoAck.

5.2.4.3 When generated

The MA-UNITDATA-STATUS.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity to indicate the status of the service provided for the corresponding MA-UNITDATA.request primitive.

5.2.4.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent upon the type of operation employed by the LLC sublayer entity.
6. Layer management

6.1 Overview of management model

Both the MAC sublayer and PHY conceptually include management entities, called MLME and PLME, respectively. These entities provide the layer management service interfaces through which layer management functions are invoked.

In order to provide correct MAC operation, an SME is present within each STA. The SME is a layer-independent entity that resides in a separate management plane or resides “off to the side.” Some of the functions of the SME are specified in this standard. Typically this entity is responsible for such functions as the gathering of layer-dependent status from the various layer management entities (LMEs), and similarly setting the value of layer-specific parameters. The SME would typically perform such functions on behalf of general system management entities and would implement standard management protocols. Figure 4-14 (in 4.9) depicts the relationship among management entities.

The various entities within this model interact in various ways. Certain of these interactions are defined explicitly within this standard, via a SAP across which defined primitives are exchanged. This definition includes the GET and SET operations between MLME, PLME and SME as well as other individually defined service primitives, represented as double arrows within Figure 6-1. Other interactions are not defined explicitly within this standard, such as the interfaces between the MAC and MLME and between the PLME and PLCP and PMD; the specific manner in which these MAC and PHY LMEs are integrated into the overall MAC sublayer and PHY is not specified within this standard.

The management SAPs within this model are the following:

- SME-MLME SAP
- SME-PLME SAP
- MLME-PLME SAP

The latter two SAPs support identical primitives, and in fact might be viewed as a single SAP (called the PLME SAP) that is used either directly by MLME or by SME. In this fashion, the model reflects what is
anticipated to be a common implementation approach in which PLME functions are controlled by the MLME (on behalf of SME).

6.2 Generic management primitives

The management information specific to each layer is represented as a MIB for that layer. The MLME and PLME are viewed as “containing” the MIB for that layer. The generic model of MIB-related management primitives exchanged across the management SAPs is to allow the SAP user-entity to either GET the value of a MIB attribute, or to SET the value of a MIB attribute. The invocation of a SET.request primitive might require that the layer entity perform certain defined actions.

Figure 6-1 depicts these generic primitives.

The GET and SET primitives are represented as REQUESTs with associated CONFIRM primitives. These primitives are prefixed by MLME or PLME depending upon whether the MAC sublayer or PHY management SAP is involved. In the following, XX denotes MLME or PLME:

**XX-GET.request(MIBattribute)**
- Requests the value of the given MIB attribute.

**XX-GET.confirm(status, MIBattribute, MIBattributevalue)**
- Returns the appropriate MIB attribute value if status = “success,” otherwise returns an error indication in the Status field. Possible error status values include “invalid MIB attribute” and “attempt to get write-only MIB attribute.”

**XX-SET.request(MIBattribute, MIBattributevalue)**
- Requests that the indicated MIB attribute be set to the given value. If this MIB attribute implies a specific action, then this requests that the action be performed.

**XX-SET.confirm(status, MIBattribute)**
- If status = “success,” this confirms that the indicated MIB attribute was set to the requested value; otherwise it returns an error condition in status field. If this MIB attribute implies a specific action, then this confirms that the action was performed. Possible error status values include “invalid MIB attribute” and “attempt to set read-only MIB attribute.”

Additionally, there are certain requests that can be invoked across a given SAP that do not involve the setting or getting of a specific MIB attribute. One of these is supported by each SAP, as follows:

- **XX-RESET.request:** where XX is MLME or PLME as appropriate

This service is used to initialize the management entities, the MIBs, and the datapath entities. It might include a list of attributes for items to be initialized to nondefault values.

Other SAP-specific primitives are identified in 6.3.

6.3 MLME SAP interface

6.3.1 Introduction

The services provided by the MLME to the SME are specified in this subclause. These services are described in an abstract way (following the model described in ITU-T Recommendation X.210 [B50]) and do not imply any particular implementation or exposed interface. MLME SAP primitives are of the general form ACTION.request followed by ACTION.confirm (for an exchange initiated by the SAP client) and
ACTION.indication followed by ACTION.response (for an exchange initiated by the MLME). The SME uses the services provided by the MLME through the MLME SAP.

6.3.2 Power management

6.3.2.1 Introduction

This mechanism supports the process of establishment and maintenance of the power management mode of a STA.

6.3.2.2 MLME-POWERMGT.request

6.3.2.2.1 Function

This primitive requests a change in the power management mode.

6.3.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.request(
    PowerManagementMode,
    WakeUp,
    ReceiveDTIMs
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PowerManagementMode</td>
<td>Enumeration</td>
<td>ACTIVE, POWER_SAVE</td>
<td>An enumerated type that describes the desired power management mode of the STA.</td>
</tr>
<tr>
<td>WakeUp</td>
<td>Boolean</td>
<td>true, false</td>
<td>When true, the MAC is forced immediately into the Awake state. This parameter has no effect if the current power management mode is ACTIVE.</td>
</tr>
<tr>
<td>ReceiveDTIMs</td>
<td>Boolean</td>
<td>true, false</td>
<td>When true, this parameter causes the STA to awaken to receive all DTIM frames. When false, the STA is not required to awaken for every DTIM frame.</td>
</tr>
</tbody>
</table>

6.3.2.2.3 When generated

This primitive is generated by the SME to implement the power-saving strategy of an implementation.

6.3.2.2.4 Effect of receipt

This request sets the STA’s power management parameters. The MLME subsequently issues a MLME-POWERMGT.confirm primitive that reflects the results of the power management change request.

6.3.2.3 MLME-POWERMGT.confirm

6.3.2.3.1 Function

This primitive confirms the change in power management mode.
6.3.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-POWERMGT.confirm(
    ResultCode
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, NOT_SUPPORTED</td>
<td>Indicates the result of the MLME-POWERMGT.request.</td>
</tr>
</tbody>
</table>

6.3.2.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-POWERMGT.request primitive to establish a new power management mode. It is not generated until the change has completed as defined in 10.2.1.

6.3.2.3.4 Effect of receipt

The SME is notified of the change of power management mode.

6.3.3 Scan

6.3.3.1 Introduction

This mechanism supports the process of determining the characteristics of the available BSSs.

6.3.3.2 MLME-SCAN.request

6.3.3.2.1 Function

This primitive requests a survey of potential BSSs that the STA can later elect to try to join.

6.3.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-SCAN.request(
    BSSType,
    BSSID,
    SSID,
    ScanType,
    ProbeDelay,
    ChannelList,
    MinChannelTime,
    MaxChannelTime,
    RequestInformation,
    SSID List,
    ChannelUsage,
    AccessNetworkType,
    HESSID,
    MeshID,
    VendorSpecificInfo
)
```
### Table 8-173

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSSType</td>
<td>Enumeration</td>
<td>INFRASTRUCTURE, INDEPENDENT, MESH, ANY_BSS</td>
<td>Determines whether infrastructure BSS, IBSS, MBSS, or all, are included in the scan.</td>
</tr>
<tr>
<td>BSSID</td>
<td>MACAddress</td>
<td>Any valid individual or broadcast MAC address</td>
<td>Identifies a specific or wildcard BSSID.</td>
</tr>
<tr>
<td>SSID</td>
<td>Octet string</td>
<td>0–32 octets</td>
<td>Specifies the desired SSID or the wildcard SSID.</td>
</tr>
<tr>

<td>0 to 15</td>
<td>Specifies a desired specific access network type or the wildcard access network type. This field is present when dot11InterworkingServiceActivated is true.</td>
</tr>
<tr>
<td>HESSID</td>
<td>MAC Address</td>
<td>Any valid individual MAC address or the broadcast MAC address</td>
<td>Specifies the desired specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true.</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>Octet string</td>
<td>0–32 octets</td>
<td>Only present if BSSType = MESH or BSSType = ANY_BSS. Specifies the desired Mesh ID or wildcard Mesh ID.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

#### 6.3.3.2.3 When generated

This primitive is generated by the SME for a STA to determine if there are other BSSs that it can join.

#### 6.3.3.2.4 Effect of receipt

This request initiates the scan process when the current frame exchange sequence is completed.
6.3.3.3 MLME-SCAN.confirm

6.3.3.3.1 Function

This primitive returns the descriptions of the set of BSSs detected by the scan process.

6.3.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCAN.confirm(
    BSSDescriptionSet,
    BSSDescriptionFromMeasurementPilotSet,
    ResultCode,
    VendorSpecificInfo
)

Each BSSDescription consists of the elements shown in the following table, in which the term peer STA refers to the STA transmitting the Beacon frame or Probe Response frame from which the BSSDescription was determined and the term local STA refers to the STA performing the scan, and in which the “IBSS adoption” column indicates whether

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSSID</td>
<td>MAC Address</td>
<td>N/A</td>
<td>The BSSID of the found BSS or the MAC address of the found mesh STA.</td>
</tr>
<tr>
<td>SSID</td>
<td>Octet string</td>
<td>0–32 octets</td>
<td>The SSID of the found BSS.</td>
</tr>
<tr>
<td>BSSType</td>
<td>Enumeration</td>
<td>INFRASTRUCTURE, INDEPENDENT, MESH</td>
<td>The type of the found BSS.</td>
</tr>
</tbody>
</table>

Each BSSDescription consists of the elements shown in the following table, in which the term peer STA refers to the STA transmitting the Beacon frame or Probe Response frame from which the BSSDescription was determined and the term local STA refers to the STA performing the scan, and in which the “IBSS adoption” column indicates whether

a) This parameter is adopted by a STA that is joining an IBSS.

b) This parameter is adopted by a STA that is a member of an IBSS that receives a beacon from a STA that is a member of the same IBSS and that has a timestamp value that is greater than the local TSF value (see 10.1.5).
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
<th>IBSS adoption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beacon Period</td>
<td>Integer</td>
<td>N/A</td>

### 6.3.3.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-SCAN.request primitive to ascertain the operating environment of the STA.

### 6.3.3.4 Effect of receipt

The SME is notified of the results of the scan procedure.

### 6.3.4 Synchronization

#### 6.3.4.1 Introduction

This mechanism supports the process of selection of a peer in the authentication process.

#### 6.3.4.2 MLME-JOIN.request

#### 6.3.4.2.1 Function

This primitive requests synchronization with a BSS, of which type is infrastructure or independent.
6.3.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-JOIN.request(
    SelectedBSS,
    JoinFailureTimeout,
    ProbeDelay,
    OperationalRateSet,
    HTOperationalMCS,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SelectedBSS</td>
<td>BSSDescription</td>

</tr>
<tr>
<td>JoinFailureTimeout</td>
<td>Integer</td>
<td>≥ 1</td>
<td>The time limit, in units of beacon intervals, after which the join procedure is terminated.</td>
</tr>
<tr>
<td>ProbeDelay</td>
<td>Integer</td>
<td>N/A</td>
<td>Delay (in microseconds) to be used prior to transmitting when changing from Doze to Awake, if no frame sequence is detected by which the NAV can be set.</td>
</tr>
<tr>
<td>OperationalRateSet</td>
<td>Set of integers</td>
<td>1–127 inclusive (for each integer in the set)</td>
<td>The set of data rates that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter.</td>
</tr>
<tr>
<td>HTOperationalMCS</td>
<td>Set of integers</td>
<td>0–76, representing an MCS index value (for each member of the set)</td>
<td>The set of MCS values that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the MCS values contained in the BSSBasicMCSSet parameter.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.4.2.3 When generated

This primitive is generated by the SME for a STA to establish synchronization with a BSS.

6.3.4.2.4 Effect of receipt

This primitive initiates a synchronization procedure once the current frame exchange sequence is complete. The MLME synchronizes its timing with the specified BSS based on the elements provided in the SelectedBSS parameter. The MLME subsequently issues a MLME-JOIN.confirm primitive that reflects the results.

If an MLME receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet element that contains any unsupported rates, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.
If the MLME of an HT STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicMCSSet value that contains any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

### 6.3.4.3 MLME-JOIN.confirm

#### 6.3.4.3.1 Function

This primitive confirms synchronization with a BSS.

#### 6.3.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-JOIN.confirm(
    ResultCode,  
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, INVALID_PARAMETERS</td>
<td>Indicates the result of the MLME-JOIN.request primitive.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

#### 6.3.4.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-JOIN.request primitive to establish synchronization with a BSS.

#### 6.3.4.3.4 Effect of receipt

The SME is notified of the results of the synchronization procedure.

### 6.3.5 Authenticate

#### 6.3.5.1 Introduction

This mechanism supports the process of establishing an authentication relationship with a peer MAC entity.

#### 6.3.5.2 MLME-AUTHENTICATE.request

##### 6.3.5.2.1 Function

This primitive requests authentication with a specified peer MAC entity.

##### 6.3.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-AUTHENTICATE.request(
    PeerSTAAddress,  
    AuthenticationType,  
    AuthenticateFailureTimeout,
    ...
)
```
6.3.5.2.3 When generated

This primitive is generated by the SME for a STA to establish authentication with a specified peer MAC entity in order to permit Class 2 frames, or Mesh Peering Management frames for AMPE utilizing SAE authentication (when dot11AuthenticationAlgorithm is simultaneousAuthEquals (4)), to be exchanged between the two STAs. During the authentication procedure, the SME might generate additional MLME-AUTHENTICATE.request primitives.

6.3.5.2.4 Effect of receipt

This primitive initiates an authentication procedure. The MLME subsequently issues a MLME-AUTHENTICATE.confirm primitive that reflects the results.

6.3.5.3 MLME-AUTHENTICATE.confirm

6.3.5.3.1 Function

This primitive reports the results of an authentication attempt with a specified peer MAC entity.

6.3.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.confirm(
    PeerSTAAddress,
    AuthenticationType,
    ResultCode,
)```

---

### 6.3.5.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AUTHENTICATE.request primitive to authenticate with a specified peer MAC entity.

### 6.3.5.3.4 Effect of receipt

The SME is notified of the results of the authentication procedure.

### 6.3.5.4 MLME-AUTHENTICATE.indication

#### 6.3.5.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an authentication relationship with the STA processing this primitive.
6.3.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.indication(
    PeerSTAAddress,
    AuthenticationType,
    Content of FT Authentication elements,
    Content of SAE Authentication Frame,
    VendorSpecificInfo
)

6.3.5.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an authentication request from a specific peer MAC entity.

6.3.5.4.4 Effect of receipt

The SME is notified of the receipt of the authentication request.

6.3.5.5 MLME-AUTHENTICATE.response

6.3.5.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested authentication with the STA that issued this primitive.

6.3.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.response(
    PeerSTAAddress,
    ResultCode,
    Name Type Valid range Description
    PeerSTAAddress MACAddress Any valid individual MAC address Specifies the address of the peer MAC entity with which the authentication relationship was established.
    AuthenticationType Enumeration OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE Specifies the type of authentication algorithm that was used during the authentication process.
    Content of FT Authentication elements Sequence of elements As defined in 12.8 The set of elements included in the first message of the FT authentication sequence, as described in 12.8.2. Present only if dot11FastBSSTransitionActivated is true.
    Content of SAE Authentication Frame Sequence of elements As defined in 8.4.1.37, 8.4.1.38, 8.4.1.39, 8.4.1.40, 8.4.1.41, and 8.4.1.42 The set of elements to be included in the SAE Commit Message or SAE Confirm Message. Present only if AuthenticationType indicates SAE authentication.
    VendorSpecificInfo A set of elements As defined in 8.4.2.28 Zero or more elements.
6.3.5.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-AUTHENTICATE.indication primitive.

6.3.5.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested authentication.

6.3.6 Deauthenticate

6.3.6.1 Introduction

This mechanism supports the process of invalidating an authentication relationship with a peer MAC entity.

6.3.6.2 MLME-DEAUTHENTICATE.request

6.3.6.2.1 Function

This primitive requests that the authentication relationship with a specified peer MAC entity be invalidated.
6.3.6.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DEAUTHENTICATE.request(}
\begin{align*}
\text{PeerSTAAddress}, \\
\text{ReasonCode}, \\
\text{VendorSpecificInfo}
\end{align*}
\)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which to perform the deauthentication process.</td>
</tr>
<tr>
<td>ReasonCode</td>
<td>Reason Code field</td>
<td>As defined in 8.4.1.7</td>
<td>Specifies the reason for initiating the deauthentication procedure.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.6.2.3 When generated

This primitive is generated by the SME for a STA to invalidate authentication with a specified peer MAC entity in order to prevent the exchange of Class 2 frames, or Mesh Peering Management frames for AMPE utilizing SAE authentication (when dot11AuthenticationAlgorithm is simultaneousAuthEquals (4)), between the two STAs. During the deauthentication procedure, the SME might generate additional MLME-DEAUTHENTICATE.request primitives.

6.3.6.2.4 Effect of receipt

This primitive initiates a deauthentication procedure. The MLME subsequently issues a MLME-DEAUTHENTICATE.confirm primitive that reflects the results.

6.3.6.3 MLME-DEAUTHENTICATE.confirm

6.3.6.3.1 Function

This primitive reports the results of a deauthentication attempt with a specified peer MAC entity.

6.3.6.3.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-DEAUTHENTICATE.confirm(}
\begin{align*}
\text{PeerSTAAddress}
\end{align*}
\)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which the deauthentication process was attempted.</td>
</tr>
</tbody>
</table>

6.3.6.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DEAUTHENTICATE.request primitive to invalidate the authentication relationship with a specified peer MAC entity.
6.3.6.3.4 Effect of receipt

The SME is notified of the results of the deauthentication procedure.

6.3.6.4 MLME-DEAUTHENTICATE.indication

6.3.6.4.1 Function

This primitive reports the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DEAUTHENTICATE.indication(}
\text{PeerSTAAddress,}
\text{ReasonCode,}
\text{VendorSpecificInfo}
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which the authentication</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>relationship was invalidated.</td>
</tr>
<tr>
<td>ReasonCode</td>
<td>Reason Code field</td>
<td>As defined in 8.4.1.7</td>
<td>Specifies the reason the deauthentication procedure was initiated.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.6.4.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.4 Effect of receipt

The SME is notified of the invalidation of the specific authentication relationship.

6.3.7 Associate

6.3.7.1 Introduction

The following primitives describe how a STA becomes associated with an AP.

6.3.7.2 MLME-ASSOCIATE.request

6.3.7.2.1 Function

This primitive requests association with a specified peer MAC entity that is within an AP.

6.3.7.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ASSOCIATE.request(}
\text{PeerSTAAddress,}
\text{)}
\]
AssociateFailureTimeout, CapabilityInformation, ListenInterval, Supported Channels, RSN, QoS Capability, Content of FT Authentication elements, SupportedOperatingClasses, HT Capabilities, Extended Capabilities, 20/40 BSS Coexistence, QoS TrafficCapability, TIMBroadcastRequest, EmergencyServices, VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which to perform the association process.</td>
</tr>
<tr>
<td>AssociateFailureTimeout</td>
<td>Integer</td>
<td>≥ 1</td>
<td>Specifies a time limit (in TU) by dot11AssociationResponseTimeOut, after which the associate procedure is terminated.</td>
</tr>
<tr>
<td>CapabilityInformation</td>
<td>Capability Information field</td>
<td>As defined in 8.4.1.4</td>
<td>Specifies the requested operational capabilities to the AP.</td>
</tr>
<tr>
<td>ListenInterval</td>
<td>Integer</td>
<td>≥ 0</td>
<td>Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode.</td>
</tr>
<tr>
<td>Supported Channels</td>
<td>As defined in the Supported Channels element</td>
<td>As defined in the Supported Channels element</td>
<td>The list of channels in which the STA is capable of operating. Present only if DFS functionality is required, as specified in 10.9.</td>
</tr>
<tr>
<td>RSN</td>
<td>RSNE</td>
<td>As defined in 8.4.2.27</td>
<td>A description of the cipher suites and AKM suites selected by the STA.</td>
</tr>
<tr>
<td>QoS Capability</td>
<td>QoS Capability element</td>
<td>As defined in 8.4.2.37</td>
<td>Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present only if dot11QosOptionImplemented is true.</td>
</tr>
<tr>
<td>Content of FT Authentication elements</td>
<td>Sequence of elements</td>
<td>As defined in 12.4</td>
<td>The set of elements to be included in the initial mobility domain association request, as described in 12.4. Present only if dot11FastBSSTransitionActivated is true.</td>
</tr>
<tr>
<td>SupportedOperatingClasses</td>
<td>As defined in the Supported Operating Classes element</td>
<td>As defined in 8.4.2.56</td>
<td>Specifies the supported operating classes capabilities of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true.</td>
</tr>
<tr>
<td>HT Capabilities</td>
<td>As defined in frame format</td>
<td>As defined in 8.4.2.58</td>
<td>Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is present if dot11HighThroughputOptionImplemented is true and is absent otherwise.</td>
</tr>
</tbody>
</table>
Additional parameters needed to perform the association procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

### 6.3.7.2.3 When generated

This primitive is generated by the SME when a STA wishes to establish association with an AP.

### 6.3.7.2.4 Effect of receipt

This primitive initiates an association procedure. The MLME subsequently issues an MLME-ASSOCIATE.confirm primitive that reflects the results.

### 6.3.7.3 MLME-ASSOCIATE.confirm

#### 6.3.7.3.1 Function

This primitive reports the results of an association attempt with a specified peer MAC entity that is within an AP.

#### 6.3.7.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-ASSOCIATE.confirm(
    ResultCode,
    CapabilityInformation,
    AssociationID,
)
```
SupportedRates,
EDCAParameterSet,
RCPI.request,

</tbody>
</table>
6.3.7.3 When generated

This primitive is generated by the MLME as a result of an MLME-ASSOCIATE.request primitive or receipt of an association response frame from the peer MAC entity to associate with a specified peer MAC entity that is within an AP.

6.3.7.4 Effect of receipt

The SME is notified of the results of the association procedure.

6.3.7.4 MLME-ASSOCIATE.indication

6.3.7.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting association with the local MAC entity, which is within an AP.

6.3.7.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.indication(
    PeerSTAAddress,
    CapabilityInformation,
    ListenInterval,
    SSID,
    SupportedRates,
    RSN,
    QoSCapability,
    RCPI,
    RSNI,
)

</table>
6.3.7.5.3 When generated

This primitive is generated by the SME of a STA that is within an AP as a response to an MLME-ASSOCIATE.indication primitive.

6.3.7.5.4 Effect of receipt

This primitive initiates transmission of an AssociationResponse to the specific peer MAC entity that requested association.

6.3.8 Reassociate

6.3.8.1 Introduction

The following primitives describe how a STA becomes associated with another AP.

6.3.8.2 MLME-REASSOCIATE.request

6.3.8.2.1 Function

This primitive requests a change in association to a specified new peer MAC entity that is within an AP.

6.3.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.request(
    NewAPAddress,
    ReassociateFailureTimeout,
    CapabilityInformation,
    ListenInterval,
    SupportedChannels)
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoS_trafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,
EmergencyServices,
VendorSpecificInfo
)

<table>

</tbody>
</table>

Additional parameters needed to perform the reassociation procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

**6.3.8.2.3 When generated**

This primitive is generated by the SME for a STA to change association to a specified new peer MAC entity that is within an AP.

**6.3.8.2.4 Effect of receipt**

This primitive initiates a reassociation procedure. The MLME subsequently issues a MLME-REASSOCIATE.confirm primitive that reflects the results.

**6.3.8.3 MLME-REASSOCIATE.confirm**

**6.3.8.3.1 Function**

This primitive reports the results of a reassociation attempt with a specified peer MAC entity that is within an AP.
6.3.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.confirm(
    ResultCode,
    CapabilityInformation,
    AssociationID,
    SupportedRates,
    EDCAParameterSet,
    RCPI.request,
    RSNI.request,
    RCPI.response,
    RSNI.response,
    RMEncabledCapabilities,
    Content of FT Authentication elements,
    SupportedOperatingClasses,
    HT Capabilities,
    Extended Capabilities,
    20/40 BSS Coexistence,
    TimeoutInterval,
    BSSMaxIdlePeriod,
    TIMBroadcastResponse,
    FMSRespone,
    DMSResponse,
    QoSMapSet,
    VendorSpecificInfo
)

### 6.3.8.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-REASSOCIATE.request primitive to reassociate with a specified peer MAC entity that is within an AP.

### 6.3.8.3.4 Effect of receipt

The SME is notified of the results of the reassociation procedure.

### 6.3.8.4 MLME-REASSOCIATE.indication

#### 6.3.8.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting reassociation with the local MAC entity, which is within an AP.

#### 6.3.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```mlme-reassociate.indication()`
PeerSTAAddress,  
CurrentAPAddress,  
CapabilityInformation,  
ListenInterval,  
SSID,  
SupportedRates,  
RSN,  
QoS Capability,  
RCPI,  
RSNI,  
RMEnabledCapabilities,  
Content of FT Authentication elements,  
SupportedOperatingClasses,  
DSERegisteredLocation,  
HT Capabilities,  
Extended Capabilities,  
20/40 BSS Coexistence,  
QoS Traffic Capability,  
TIM Broadcast Request,  
FMS Request,  
DMS Request,  
Emergency Services,  
Vendor Specific Info

<td>Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11MgmtOptionDMSActivated is true, and is not present otherwise.</td>
</tr>
</tbody>
</table>
6.3.8.4.3 When generated

This primitive is generated by the MLME as a result of the establishment of a reassociation with a specific peer MAC entity that resulted from a reassociation procedure that was initiated by that specific peer MAC entity.

6.3.8.4.4 Effect of receipt

The SME is notified of the establishment of the reassociation.

6.3.8.5 MLME-REASSOCIATE.response

6.3.8.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested a reassociation with the STA that issued this primitive, which is within an AP.

6.3.8.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REASSOCIATE.response(
    PeerSTAAddress,
    ResultCode,
    CapabilityInformation,
    AssociationID,
    EDCAParameterSet,
    RCPI,

</tr>
</tbody>
</table>
6.3.8.5.3 When generated

This primitive is generated by the SME of a STA that is within an AP as a response to an MLME-REASSOCIATE.indication primitive.

6.3.8.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested reassociation.

6.3.9 Disassociate

6.3.9.1 MLME-DISASSOCIATE.request

6.3.9.1.1 Function

This primitive requests disassociation with a specified peer MAC entity.
6.3.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.request(
    PeerSTAAddress,  
    ReasonCode,  
    VendorSpecificInfo  
)

6.3.9.1.3 When generated

This primitive is generated by the SME for a STA to disassociate from a STA with which it has an association.

6.3.9.1.4 Effect of receipt

This primitive initiates a disassociation procedure. The MLME subsequently issues an MLME-DISASSOCIATE.confirm primitive that reflects the results.

6.3.9.2 MLME-DISASSOCIATE.confirm

6.3.9.2.1 Function

This primitive reports the results of a disassociation procedure with a specific peer MAC entity.

6.3.9.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.confirm(
    ResultCode,  
    VendorSpecificInfo  
)

6.3.9.2.3 When generated

This primitive is generated by the MLME as a result of an MLME-DISASSOCIATE.request primitive to disassociate with a specified peer MAC entity.
6.3.9.2.4 Effect of receipt

The SME is notified of the results of the disassociation procedure.

6.3.9.3 MLME-DISASSOCIATE.indication

6.3.9.3.1 Function

This primitive reports disassociation with a specific peer MAC entity.

6.3.9.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.indication(
    PeerSTAAddress,  
    ReasonCode,      
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which the association relationship was invalidated.</td>
</tr>
<tr>
<td>ReasonCode</td>
<td>Reason Code field</td>
<td>As defined in 8.4.1.7</td>
<td>Specifies the reason the disassociation procedure was initiated.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.9.3.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an association relationship with a specific peer MAC entity.

6.3.9.3.4 Effect of receipt

The SME is notified of the invalidation of the specific association relationship.

6.3.10 Reset

6.3.10.1 Introduction

This mechanism supports the process of resetting the MAC.

6.3.10.2 MLME-RESET.request

6.3.10.2.1 Function

This primitive requests that the MAC entity be reset.

6.3.10.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESET.request(
    STAAddress,
)
```
SetDefaultMIB
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address that is to be used by the MAC entity that is being reset. This value can be used to provide a locally administered STA address.</td>
</tr>
<tr>
<td>SetDefaultMIB</td>
<td>Boolean</td>
<td>true, false</td>
<td>If true, all MIB attributes are set to their default values. The default values are implementation dependent. If false, the MAC is reset, but all MIB attributes retain the values that were in place prior to the generation of the MLME-RESET.request primitive.</td>
</tr>
</tbody>
</table>

### 6.3.10.2.3 When generated

This primitive is generated by the SME to reset the MAC to initial conditions. The MLME-RESET.request primitive shall be used prior to use of the MLME-START.request primitive.

### 6.3.10.2.4 Effect of receipt

This primitive sets the MAC to initial conditions, clearing all internal variables to the default values. MIB attributes can be reset to their implementation-dependent default values by setting the SetDefaultMIB flag to true.

If dot11OCBActivated is true and if the SetDefaultMIB parameter is false, MAC operation shall resume in less than 2 TU after the STAAddress parameter is changed.

### 6.3.11 Start

### 6.3.11.1 Introduction

This mechanism supports the process of creating a new BSS or becoming a member of an MBSS.

### 6.3.11.2 MLME-START.request

#### 6.3.11.2.1 Function

This primitive requests that the MAC entity start a new BSS or become a member of an MBSS.

#### 6.3.11.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-START.request(

SSID,
SSIDEncoding,
BSSType,
BeaconPeriod,
DTIMPeriod,
CF parameter set,
PHY parameter set,
IBSS parameter set,
ProbeDelay,
CapabilityInformation,
BSSBasicRateSet,
OperationalRateSet,
Country,
IBSS DFS Recovery Interval,
EDCAParameterSet,
DSERegisteredLocation,
HT Capabilities,
HT Operation,
BSSMembershipSelectorSet,
BSSBasicMCSSet,
HTOperationalMCSSet,
Extended Capabilities,
20/40 BSS Coexistence,
Overlapping BSS Scan Parameters,
MultipleBSSID,
InterworkingInfo,
AdvertismentProtocolInfo,
RoamingConsortiumInfo,
Mesh ID,
Mesh Configuration,
VendorSpecificInfo
)

<td>Set of integers</td>
<td>Each member of the set takes a value in the range 0 to 76, representing an MCS index value</td>
<td>The set of MCS values that shall be supported by all HT STAs to join this BSS. The STA that is creating the BSS shall be able to receive and transmit at each of the MCS values listed in the set. If the HT Operation parameter includes a value of 1 for either the Dual Beacon field or the Dual CTS Protection field, the BSSBasicMCSSet parameter shall include at least one integer value in the range 0 to 7.</td>
</tr>
</tbody>
</table>
### 6.3.11.2.3 When generated

This primitive is generated by the SME to start an infrastructure BSS (with the MAC entity within an AP), an IBSS (with the MAC entity acting as the first STA in the IBSS), or an MBSS (with the MAC entity acting as the first mesh STA in the MBSS) or to become a member of an existing MBSS. In an MBSS, this primitive starts the process of mesh beaconing.

</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
An MLME-START.request primitive may be generated in an infrastructure BSS or IBSS only after an MLME-RESET.request primitive has been used to reset the MAC entity and before an MLME-JOIN.request primitive has been used to successfully join an existing infrastructure BSS or IBSS.

An MLME-START.request primitive may be generated in an MBSS only after an MLME-RESET.request primitive has been used to reset the MAC entity and before any synchronization and mesh peering have been established. When the mesh STA uses the default synchronization method and the default mesh peering protocol, the MLME-START.request primitive shall be generated before an MLME-MESHNEIGHBOROFFSETSYNCSTART.request primitive and MLME-MESHPEERINGMANAGEMENT.request primitive have been used.

The MLME-START.request primitive shall not be used after successful use of the MLME-START.request primitive or successful use of the MLME-JOIN.request primitive without generating an intervening MLME-RESET.request primitive.

### 6.3.11.2.4 Effect of receipt

This primitive initiates the BSS initialization procedure once the current frame exchange sequence is complete. The MLME subsequently issues an MLME-START.confirm primitive that reflects the results of the creation procedure.

If an MLME receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any unsupported rates, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-START.request primitive with a BSSBasicMCSSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If an MLME receives an MLME-START.request primitive with the SSIDEncoding parameter value UTF8, the MLME shall set the UTF-8 SSID subfield of the Extended Capabilities element to one in Beacon and Probe Response frames.

### 6.3.11.3 MLME-START.confirm

#### 6.3.11.3.1 Function

This primitive reports the results of a BSS creation procedure or a procedure to become a member of an MBSS.

#### 6.3.11.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```plaintext
MLME-START.confirm( ResultCode )
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>resetDescription</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, BSS_ALREADY_STARTED_OR_JOINED, RESET_REQUIRED_BEFORE_START, NOT_SUPPORTED</td>
<td>Indicates the result of the MLME-START.request primitive.</td>
</tr>
</tbody>
</table>
6.3.11.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-START.request primitive to create a new BSS or to become a member of an MBSS.

6.3.11.3.4 Effect of receipt

The SME is notified of the results of the BSS creation procedure or a procedure to become a member of an MBSS.

6.3.12 Stop

6.3.12.1 General

This mechanism supports the process of terminating an existing BSS.

6.3.12.2 MLME-STOP.request

6.3.12.2.1 Function

This primitive requests that the MAC entity stop a BSS previously started by using an MLME-START.request primitive.

6.3.12.2.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-STOP.request(SSID)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSID</td>
<td>Octet string</td>
<td>0–32 octets</td>
<td>The SSID of the BSS to be stopped.</td>
</tr>
</tbody>
</table>

6.3.12.2.3 When generated

This primitive is generated by the SME to terminate an infrastructure BSS (with the MAC entity within an AP). The MLME-STOP.request primitive shall be generated only after successful use of an MLME-START.confirm primitive.

The MLME-STOP termination procedure does not reset the MAC to initial conditions. An MLME-RESET.request primitive shall be issued prior to use of the MLME-START.request primitive and subsequent to the use of an MLME-STOP.request primitive.

The SME should notify associated non-AP STAs of imminent infrastructure BSS termination before issuing the MLME-STOP.request. This can be done with the BSS Transition Management procedure, using the Termination information.

6.3.12.2.4 Effect of receipt

This primitive initiates the termination of the BSS. All services provided by the AP to an infrastructure BSS, including Beacons, Probe Responses and access to the DS, are stopped by the termination. All STAs in an infrastructure BSS are deauthenticated by the termination.
6.3.13 Protocol layer model for spectrum management and radio measurement

The layer management extensions for measurement, TPC, and channel switching assume a certain partition of functionality between the MLME and SME. This partitioning assumes that policy decisions (e.g., regarding measurement and channel switching) reside in the SME, while the protocol for measurement, switch timing, and the associated frame exchanges resides within the MLME (see Figure 6-2).

![Figure 6-2—Layer management model](image)

The informative diagrams within this subclause further illustrate the protocol layer model adopted. Figure 6-3 and Figure 6-4 depict the measurement process for a peer STA to accept and reject a measurement request, respectively. Figure 6-5 illustrates the TPC adaptation process. Lastly, Figure 6-6 depicts the management process for a channel switch using a Channel Switch Announcement frame.

It should be noted that these diagrams are intended as examples and do not depict all possible protocol scenarios, e.g., a measurement request may result in more than one measurement report frame as described in 10.9.7 and 10.11.

6.3.14 Measurement request

6.3.14.1 Introduction

This set of primitives supports the signaling of measurement requests between peer SMEs.

6.3.14.2 MLME-MREQUEST.request

6.3.14.2.1 Function

This primitive requests the transmission of a measurement request to a peer entity.

6.3.14.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Measurement Request Set,
    Number of Repetitions,
    Measurement Category,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.14.2.3 When generated

This primitive is generated by the SME to request that a Measurement Request frame be sent to a peer entity to initiate one or more measurements.

6.3.14.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Request frame containing the set of Measurement Request elements specified. This frame is then scheduled for transmission.

6.3.14.3 MLME-MREQUEST.indication

6.3.14.3.1 Function

This primitive indicates that a Measurement Request frame has been received requesting the measurement of one or more channels.

6.3.14.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MMLME-MREQUEST.indication(
   Peer MAC Address,
   Dialog Token,
   Measurement Request Set,
   Number of Repetitions,
   Measurement Category,
   VendorSpecificInfo
)

<table>

</tbody>
</table>
6.3.14.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Request frame is received.

6.3.14.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the requested measurements.

6.3.15 Channel measurement

6.3.15.1 Introduction

This set of primitives supports the requesting and reporting of measurement data.

6.3.15.2 MLME-MEASURE.request

6.3.15.2.1 Function

This primitive is generated by the SME to request that the MLME initiate specified measurements.

6.3.15.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MEASURE.request(}
\begin{array}{ll}
\text{Dialog Token,} \\
\text{Measurement Request Set,} \\
\text{VendorSpecificInfo}
\end{array}
\)

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.15.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified measurements.

6.3.15.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the measurement process.

6.3.15.3 MLME-MEASURE.confirm

6.3.15.3.1 Function

This primitive reports the result of a measurement.
6.3.15.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MEASURE.confirm(}
\text{ResultCode,}
\text{Dialog Token,}
\text{Measurement Report Set,}
\text{VendorSpecificInfo}
\text{)}
\]

<table>

</tr>
</tbody>
</table>

6.3.15.3.3 When generated

This primitive is generated by the MLME to report the results when a measurement set completes.

6.3.15.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result code and, if appropriate, stores the channel measurements pending communication to the requesting entity or for local use.

6.3.16 Measurement report

6.3.16.1 Introduction

This set of primitives supports the signaling of measurement reports.

6.3.16.2 MLME-MREPORT.request

6.3.16.2.1 Function

This primitive supports the signaling of measurement reports between peer SMEs.

6.3.16.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MREPORT.request(}
\text{Peer MAC Address,}
\text{Dialog Token,}
\text{Measurement Report Set,}
\text{Measurement Category,}
\text{VendorSpecificInfo}
\text{)}
\]
### 6.3.16.2.3 When generated

This primitive is generated by the SME to request that a frame be sent to a peer entity to report the results of measuring one or more channels.

### 6.3.16.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Report frame containing the set of measurement reports. This frame is then scheduled for transmission.

### 6.3.16.3 MLME-MREPORT.indication

#### 6.3.16.3.1 Function

This primitive indicates that a Measurement Report frame has been received from a peer entity. This management report is either a response to an earlier measurement request (e.g., MLME-MREQUEST.request primitive) or an autonomous report.

#### 6.3.16.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREPORT.indication(
    Peer MAC Address,
    Dialog Token,
    Measurement Report Set,
    Measurement Category,
    VendorSpecificInfo
)
```

</tbody>
</table>
6.3.16.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Report frame is received.

6.3.16.3.4 Effect of receipt

On receipt of this primitive, measurement data might be available for SME processes, such as channel selection.

6.3.17 Channel switch

6.3.17.1 MLME-CHANNELSWITCH.request

6.3.17.1.1 Function

This primitive requests a switch to a new operating channel.

6.3.17.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELSWITCH.request(
  Mode,
  Channel Number,
  Secondary Channel Offset,
  Channel Switch Count,
  Mesh Channel Switch Parameters,
  VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>

<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
The Secondary Channel Offset parameter may be present for HT STAs.

### 6.3.17.1.3 When generated

This primitive is generated by the SME to schedule a channel switch and announce this switch to peer entities in the BSS.

### 6.3.17.1.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch event and announces this switch to other STAs in the BSS using the Channel Switch Announcement frame or element. The MLME sets the timing of the frame transmission taking into account the activation delay.

### 6.3.17.2 MLME-CHANNELSWITCH.confirm

#### 6.3.17.2.1 Function

This primitive reports the result of a request to switch channel.

#### 6.3.17.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CHANNELSWITCH.confirm}( \text{ResultCode}, \text{VendorSpecificInfo} )
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>

</tr>
</tbody>
</table>

#### 6.3.17.2.3 When generated

This primitive is generated by the MLME when a channel switch request completes. Possible unspecified failure causes include an inability to schedule a channel switch announcement.
6.3.17.2.4 Effect of receipt

The SME is notified of the results of the channel switch procedure.

6.3.17.3 MLME-CHANNELSWITCH.indication

6.3.17.3.1 Function

This primitive indicates that a channel switch announcement has been received from a peer entity.

6.3.17.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CHANNELSWITCH.indication(}
\begin{align*}
\text{Peer MAC Address}, \\
\text{Mode}, \\
\text{Channel Number}, \\
\text{Secondary Channel Offset}, \\
\text{Channel Switch Count}, \\
\text{Mesh Channel Switch Parameters}, \\
\text{VendorSpecificInfo}
\end{align*}
\]

</tbody>
</table>

6.3.17.3.3 When generated

This primitive is generated by the MLME when a valid Channel Switch Announcement frame is received.

6.3.17.3.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch.
6.3.17.4 MLME-CHANNELSWITCH.response

6.3.17.4.1 Function

This primitive is used to schedule an accepted channel switch.

6.3.17.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.response(
    Mode,
    Channel Number,
    Secondary Channel Offset,
    Channel Switch Count,
    Mesh Channel Switch Parameters,
    VendorSpecificInfo
)
```

</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.17.4.3 When generated

This primitive is generated by the SME to schedule an accepted channel switch request.

6.3.17.4.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch.

6.3.18 TPC request

6.3.18.1 Introduction

This set of primitives supports the adaptation of transmit power between peer entities as described in 10.8.6.
6.3.18.2 MLME-TPCADAPT.request

6.3.18.2.1 Function

This primitive supports the adaptation of transmit power between peer entities as specified in 10.8.6.

6.3.18.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TPCADAPT.request(
    Peer MAC Address,
    Dialog Token,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual or group MAC address</td>
<td>The address of the peer MAC entity to which the TPC request is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the TPC transaction.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.18.2.3 When generated

This primitive is generated by the SME to request that a TPC Request frame be sent to a peer entity to request that entity to report transmit power and link margin information.

6.3.18.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TPC Request frame. This frame is then scheduled for transmission.

6.3.18.3 MLME-TPCADAPT.confirm

6.3.18.3.1 Function

This primitive reports the result of the TPC adaptation procedure.

6.3.18.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TPCADAPT.confirm(
    ResultCode
    Transmit Power,
    Link Margin,
    Rate,
    VendorSpecificInfo
)
6.3.18.3.3 When generated

This primitive is generated by the MLME when the TPC adaptation procedure completes.

6.3.18.3.4 Effect of receipt

The SME is notified of the results of the TPC adaptation procedure.

6.3.19 SetKeys

6.3.19.1 MLME-SETKEYS.request

6.3.19.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be set in the MAC and enabled for use.

6.3.19.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETKEYS.request(

    Keylist

)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keylist</td>
<td>A set of SetKeyDescriptors</td>
<td>N/A</td>
<td>The list of keys to be used by the MAC.</td>
</tr>
</tbody>
</table>

Each SetKeyDescriptor consists of the following elements:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Bit string</td>
<td>N/A</td>
<td>The temporal key value</td>
</tr>
<tr>
<td>Length</td>
<td>Integer</td>
<td>N/A</td>
<td>The number of bits in the Key to be used.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Integer</td>
<td>0–3 shall be used with WEP, TKIP, and CCMP; 4–5 with BIP; and 6–4095 are reserved</td>
<td>Key identifier</td>
</tr>
<tr>
<td>Key Type</td>
<td>Integer</td>
<td>Group, Pairwise, PeerKey, IGTK</td>
<td>Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.</td>
</tr>
</tbody>
</table>
6.3.19.1.3 When generated

This primitive is generated by the SME at any time when one or more keys are to be set in the MAC.

6.3.19.1.4 Effect of receipt

Receipt of this primitive causes the MAC to apply the keys as follows provided the MLME-SETPROTECTION.request primitive has been issued:

— If the Direction element of the SetKeyDescriptor indicates Transmit or Both then the MAC uses the key information for the transmission of all subsequent frames to which the key applies.

— If the Direction element of the SetKeyDescriptor indicates Receive or Both then the MAC installs the key with the associated Key ID such that received frames of the appropriate type and containing the matching Key ID are processed using that key and its associated state information.

6.3.20 DeleteKeys

6.3.20.1 MLME-DELETEKEYS.request

6.3.20.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be deleted from the MAC and thus disabled for use.

6.3.20.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```plaintext
MLME-DELETEKEYS.request(
    Keylist
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keylist</td>
<td>A set of DeleteKeyDescriptors</td>
<td>N/A</td>
<td>The list of keys to be deleted from the MAC.</td>
</tr>
</tbody>
</table>
Each DeleteKeyDescriptor consists of the following elements:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key ID</td>
<td>Integer</td>
<td>N/A</td>
<td>Key identifier.</td>
</tr>
<tr>
<td>Key Type</td>
<td>Integer</td>
<td>Group, Pairwise, PeerKey, IGTK</td>
<td>Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.</td>
</tr>
<tr>
<td>Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey.</td>
</tr>
</tbody>
</table>

6.3.20.1.3 When generated

This primitive is generated by the SME at any time when keys for a security association are to be deleted in the MAC.

6.3.20.1.4 Effect of receipt

Receipt of this primitive causes the MAC to delete the temporal keys identified by the Keylist Address, including Group, Pairwise and PeerKey, and to cease using them.

6.3.21 MIC (Michael) failure event

6.3.21.1 MLME-MICHAELMICFAILURE.indication

6.3.21.1.1 Function

This primitive reports that a MIC failure event was detected.

6.3.21.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MICHAELMICFAILURE.indication (Count, Address, Key Type, Key ID, TSC)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Integer</td>
<td>1 or 2</td>
<td>The current number of MIC failure events.</td>
</tr>
<tr>
<td>Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>The source MAC address of the frame.</td>
</tr>
<tr>
<td>Key Type</td>
<td>Integer</td>
<td>Group, Pairwise, PeerKey</td>
<td>The key type that the received frame used.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Integer</td>
<td>0–3</td>
<td>Key identifier.</td>
</tr>
<tr>
<td>TSC</td>
<td>6 octets</td>
<td>N/A</td>
<td>The TSC value of the frame that generated the MIC failure.</td>
</tr>
</tbody>
</table>
6.3.21.1.3 When generated

This primitive is generated by the MAC when it has detected a MIC failure.

6.3.21.1.4 Effect of receipt

The SME is notified that the MAC has detected a MIC failure; see 11.4.2.4.

6.3.22 EAPOL

6.3.22.1 MLME-EAPOL.request

6.3.22.1.1 Function

This primitive is generated by the SME when the SME has an IEEE 802.1X EAPOL-Key frame to send.

6.3.22.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-EAPOL.request} (\text{Source Address, Destination Address, Data})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>MACAddress</td>
<td>N/A</td>
<td>The MAC sublayer address from which the EAPOL-Key frame is being sent.</td>
</tr>
<tr>
<td>Destination Address</td>
<td>MACAddress</td>
<td>N/A</td>
<td>The MAC sublayer entity address to which the EAPOL-Key frame is being sent.</td>
</tr>
<tr>
<td>Data</td>
<td>IEEE 802.1X EAPOL-Key frame</td>
<td>N/A</td>
<td>The EAPOL-Key frame to be transmitted.</td>
</tr>
</tbody>
</table>

6.3.22.1.3 When generated

This primitive is generated by the SME when the SME has a 802.1X EAPOL-Key frame to send.

6.3.22.1.4 Effect of receipt

The MAC sends this EAPOL-Key frame.

6.3.22.2 MLME-EAPOL.confirm

6.3.22.2.1 Function

This primitive indicates that this EAPOL-Key frame has been transmitted by the IEEE 802.11 MAC.

6.3.22.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-EAPOL.confirm} (\text{ResultCode})
\]
6.3.22.2.3 When generated

This primitive is generated by the MAC as a result of an MLME-EAPOL.request primitive being generated to send an EAPOL-Key frame.

6.3.22.2.4 Effect of receipt

The SME is always notified whether this EAPOL-Key frame has been transmitted to the IEEE 802.11 MAC. This primitive communicates that the frame has been transmitted; see the procedures in 11.4.2.4.1.

6.3.23 MLME-PeerKeySTART

6.3.23.1 MLME-PeerKeySTART.request

6.3.23.1.1 Function

This primitive is generated by the SME to start a PeerKey Handshake with a peer.

6.3.23.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-PeerKeySTART.request ( PeerSTAAddress, RSN )}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which to perform the PeerKey Handshake process.</td>
</tr>
<tr>
<td>RSN</td>
<td>RSNE</td>
<td>As defined in 8.4.2.27</td>
<td>A description of the cipher suites supported by initiator STA.</td>
</tr>
</tbody>
</table>

6.3.23.1.3 When generated

This primitive is generated by the SME for a STA to initiate a PeerKey Handshake with a specified peer MAC entity in order to create a secure link between the two STAs.

6.3.23.1.4 Effect of receipt

This primitive initiates the SMK Handshake as part of PeerKey Handshake by sending an EAPOL-Key message.
6.3.24 SetProtection

6.3.24.1 MLME-SETPROTECTION.request

6.3.24.1.1 Function

This primitive indicates whether protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETPROTECTION.request(

    Protectlist
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protectlist</td>
<td>A set of protection elements</td>
<td>N/A</td>
<td>The list of how each key is being used currently.</td>
</tr>
</tbody>
</table>

Each Protectlist consists of the following elements:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>This parameter is valid only when the Key Type value is Pairwise or when the Key Type value is Group and is from an IBSS STA or PeerKey.</td>
</tr>
<tr>
<td>ProtectType</td>
<td>Enumeration</td>
<td>None, Rx, Tx, Rx_Tx</td>
<td>The protection value for this MAC.</td>
</tr>
<tr>
<td>Key Type</td>
<td>Integer</td>
<td>Group, Pairwise, PeerKey, IGTK</td>
<td>Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.</td>
</tr>
</tbody>
</table>

6.3.24.1.3 When generated

This primitive is generated by the SME when protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.4 Effect of receipt

Receipt of this primitive causes the MAC to set the protection and to protect data frames as indicated in the ProtectType element of the Protectlist parameter:

- None: Specifies that data frames neither from the MAC address nor to the MAC address are protected.
- Rx: Specifies that data frames from the MAC address are protected (i.e., any data frames without protection received from the MAC address are discarded).
- Tx: Specifies that data frames to the MAC address are protected.
- Rx_Tx: Specifies that data frames to and from the MAC address are protected.

Once data frames are protected to and/or from the specified MAC address, the MLME-SETPROTECTION.request primitive is used to reset the prior setting. Invocation of the MLME-SETPROTECTION.request primitive with a ProtectType of None deletes a protection state.
6.3.25 MLME-PROTECTEDFRAMEDROPPED

6.3.25.1 MLME-PROTECTEDFRAMEDROPPED.indication

6.3.25.1.1 Function

This primitive notifies the SME that a frame has been dropped because a temporal key was unavailable.

6.3.25.1.2 Semantics of the service primitive

This primitive has two parameters, the MAC addresses of the two STAs.

The primitive parameters are as follows:

MLME-PROTECTEDFRAMEDROPPED.indication (Address1, Address2)

6.3.25.1.3 When generated

This primitive is generated by the MAC when a frame is dropped because no temporal key is available for the frame.

6.3.25.1.4 Effect of receipt

The SME is notified that a frame was dropped. The SME can use this information in an IBSS to initiate a security association to the peer STA.

6.3.26 TS management interface

6.3.26.1 General

This mechanism supports the process of adding, modifying, or deleting a TS in a BSS using the procedures defined in 10.4.

The primitives used for this mechanism are called TS Management primitives, which include MLME-ADDTS.xxx and MLME-DELTS.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a QoS Action frame. Requests and responses may cause the transmission of the corresponding QoS Action frames. Confirms and indications are issued upon the receipt of the appropriate QoS Action frame.

Table 6-1 defines which primitives are supported by which type of STA.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address1</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>MAC address of TA.</td>
</tr>
<tr>
<td>Address2</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>MAC address of RA.</td>
</tr>
</tbody>
</table>
6.3.26.2 MLME-ADDTS.request

6.3.26.2.1 Function

This primitive requests addition (or modification) of a TS. It requests the HC to admit the new or changed TS.

6.3.26.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.request (

DialogToken,
TSPEC,
TCLAS,
TCLASProcessing,
ADDTSFailureTimeout,
U-APSD Coexistence,
EBR,
VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Primitive</th>
<th>Request</th>
<th>Confirm</th>
<th>Indication</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDTS</td>
<td>non-AP QoS STA</td>
<td>non-AP QoS STA</td>
<td>HC</td>
<td>HC</td>
</tr>
<tr>
<td>DELTS</td>
<td>non-AP QoS STA and HC</td>
<td>non-AP QoS STA and HC</td>
<td>non-AP QoS STA and HC</td>
<td>—</td>
</tr>
</tbody>
</table>

Table 6-1—Supported TS management primitives

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–127</td>
<td>Specifies a number unique to the QoS Action primitives and frames used in adding (or modifying) the TS of concern.</td>
</tr>
<tr>
<td>TSPEC</td>
<td>As defined in TSPEC element with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified</td>
<td>As defined in 8.4.2.32 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified</td>
<td>Specifies the TSID, traffic characteristics, and QoS requirements of the TS of concern.</td>
</tr>
<tr>
<td>TCLAS</td>
<td>TCLAS element</td>
<td>As defined in 8.4.2.33</td>
<td>Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.</td>
</tr>
<tr>
<td>TCLASProcessing</td>
<td>TCLAS Processing element</td>
<td>As defined in 8.4.2.35</td>
<td>Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.</td>
</tr>
</tbody>
</table>
6.3.26.2.3 When generated

This primitive is generated by the SME to request the addition of a new (or modification of an existing) TS in order to support parameterized QoS transport of the MSDUs belonging to this TS when a higher layer protocol or mechanism signals the STA to initiate such an addition (or modification).

6.3.26.2.4 Effect of receipt

The STA operates according to the procedures defined in 10.4.

6.3.26.3 MLME-ADDTS.confirm

6.3.26.3.1 Function

This primitive reports the results of a TS addition (or modification) attempt.

6.3.26.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-ADDTS.confirm(
    ResultCode,
    DialogToken,
    TSDelay,
    TSPEC,
    Schedule,
    TCLAS,
    TCLASProcessing,
    EBR,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDTSFailure-Timeout</td>
<td>Integer</td>
<td>Greater than or equal to 1</td>
<td>Specifies a time limit (in TU) after which the TS setup procedure is terminated.</td>
</tr>
<tr>
<td>U-APSD Coexistence</td>
<td>U-APSD Coexistence element</td>
<td>As defined in 8.4.2.93.</td>
<td>Indicates the coexistence parameters for requested transmission during a U-APS D service period.</td>
</tr>
<tr>
<td>EBR</td>
<td>Expedited Bandwidth Request element</td>
<td>As defined in 8.4.2.96</td>
<td>Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
For the ResultCode value of SUCCESS, the TSPEC and the optional TCLAS parameters describe the characteristics of the TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Service Start Time, Medium Time, and any possibly unspecified minimum set of parameters (see 9.19.4.3) in the TSPEC in ADDTS Request frame] exactly match those of the matching MLME-ADDTS.request primitive.

For other values of ResultCode, no new TS has been created. In the case of REJECTED_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information about the current status of the MAC entity. In the case of REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by

<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
the HC based on information received from the SSPN interface. A TS is not created with this definition. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the TS with the suggested changes.

In the case of REJECTED_WITH_SUGGESTED_BSS_TRANSITION, non-AP STA should retry TS setup process with the newly associated AP once the transition is done.

If this is the result of a modification of an existing TS, the status of that TS remains unchanged.

6.3.26.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDTS.request primitive indicating the results of that request.

This primitive is generated when that MLME-ADDTS.request primitive is found to contain invalid parameters, when a timeout occurs, or when the STA receives a response in the form of an ADDTS Response frame in the corresponding QoS Action frame from the HC.

6.3.26.3.4 Effect of receipt

The SME is notified of the results of the TS addition (or modification) procedure.

The SME should operate according to the procedures defined in 10.4.

6.3.26.4 MLME-ADDTS.indication

6.3.26.4.1 Function

This primitive reports to the HC’s SME the request for adding (or modifying) a TS.

6.3.26.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.indication ( 
  DialogToken, 
  STAAddress, 
  TSPEC, 
  TCLAS, 
  TCLASProcessing, 
  U-APSD Coexistence, 
  EBR, 
  VendorSpecificInfo
 )

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>As defined in the received ADDTS request frame</td>
<td>Specifies a number unique to the QoS Action primitives and frames used in adding (or modifying) the TS.</td>
</tr>
<tr>
<td>STAAddress</td>
<td>MACAddress</td>
<td></td>
<td>Contains the MAC address of the STA that initiated the MLME-ADDTS.request primitive.</td>
</tr>
</tbody>
</table>
The TCLAS is optional at the discretion of the STA that originated the request.

### 6.3.26.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a request to add (or modify) a TS by a specified STA in the form of an ADDTS request frame.

### 6.3.26.4.4 Effect of receipt

The SME is notified of the request for a TS addition (or modification) by a specified STA.

This primitive solicits an MLME-ADDTS.response primitive from the SME that reflects the results of admission control at the HC on the TS requested to be added (or modified).

The SME should operate according to the procedures defined in 10.4.

The SME generates an MLME-ADDTS.response primitive within a dot11ADDTSResponseTimeout.

### 6.3.26.5 MLME-ADDTS.response

#### 6.3.26.5.1 Function

This primitive responds to the request for a TS addition (or modification) by a specified STA’s MAC entity.
6.3.26.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.response(
    ResultCode,
    DialogToken,
    STAAddress,
    TSDelay,
    TSPEC,
    Schedule,
    TCLAS,
    TCLASProcessing,
    EBR,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, INVALID_PARAMETERS,</td>
<td>Indicates the results of the corresponding MLME-ADDTS.indication primitive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>REJECTED_WITH_SUGGESTED_CHANGES,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>REJECTED_FOR_DELAY_PERIOD,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>REJECTED_WITH_SUGGESTED_BSS_TRANSITION,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>REQUESTED_TCLAS_NOT_SUPPORTED,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>TCLAS_RESOURCES_EXHAUSTED,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>REJECTED_HOME_WITH_SUGGESTED_CHANGES,</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>REJECTED_FOR_SSP_PERMISSIONS</td>
<td></td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>As defined in the corresponding MLME-ADDTS.indication</td>
<td>DialogToken of the matching MLME-ADDTS.indication primitive.</td>
</tr>
<tr>
<td>STAAddress</td>
<td>MACAddress</td>
<td></td>
<td>Contains the STA address of the matching MLME-ADDTS.indication primitive.</td>
</tr>
<tr>
<td>TSDelay</td>
<td>Integer</td>
<td>≥ 0</td>
<td>When the result code is REJECTED_FOR_DELAY_PERIOD, provides the amount of time a STA should wait before attempting another ADDTS request.</td>
</tr>
<tr>
<td>TSPEC</td>
<td>TSPEC element</td>
<td>As defined in 8.4.2.32</td>
<td>Specifies the QoS parameters of the TS.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule element</td>
<td>As defined in 8.4.2.36</td>
<td>Specifies the schedule information, service start time, SI, and the specification interval.</td>
</tr>
<tr>
<td>TCLAS</td>
<td>TCLAS element</td>
<td>As defined in 8.4.2.33</td>
<td>Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.</td>
</tr>
</tbody>
</table>
The DialogToken and STAAddress parameters contain the values from the matching MLME-ADDTS.indication primitive.

If the result code is SUCCESS, the TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTS-indication.

If the result code is REJECTED_WITH_SUGGESTED_CHANGES or REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC and TCLAS parameters represent an alternative proposed TS either based on information local to the MAC entity or using additional information received across the SSPN interface. The TS, however, is not created. The TSID and direction values within the TSPEC are as in the matching MLME-ADDTS.indication primitive. The difference may lie in the QoS (e.g., minimum data rate, mean data rate, and delay bound) values, as a result of admission control performed at the SME of the HC on the TS requested to be added (or modified) by the STA. If sufficient bandwidth is not available, the QoS values may be reduced. In one extreme, the minimum data rate, mean data rate, and delay bound may be all set to 0, indicating that no QoS is to be provided to this TS.

If the result code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION, the non-AP STA should initiate a transition query as defined in 10.23.6. Once the transition is completed, the STA should retry TS setup process, as defined in 10.4.4.

6.3.26.5.3 When generated

This primitive is generated by the SME at the HC as a result of an MLME-ADDTS.indication primitive to initiate addition (or modification) of a TS with a specified peer MAC entity or entities.

6.3.26.5.4 Effect of receipt

This primitive approves addition (or modification) of a TS requested by a specified STA’s MAC entity, with or without altering the TSPEC.

This primitive causes the MAC entity at the HC to send an ADDTS Response frame in the corresponding QoS Action management frame to the requesting STA containing the specified parameters.

6.3.26.6 MLME-DELTS.request

6.3.26.6.1 Function

This primitive requests deletion of a TS with a specified peer MAC.

This primitive may be generated at either a non-AP STA or the HC.

<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.26.6.3 When generated

This primitive is generated by the SME at a STA to initiate deletion of a TS when a higher layer protocol or mechanism signals the STA to initiate such a deletion.

6.3.26.6.4 Effect of receipt

This primitive initiates a TS deletion procedure.

This primitive causes the local MAC entity to send out a DELTS frame containing the specified parameters. If this primitive was generated at the HC, the frame is sent to the specified STA’s MAC address. If this primitive was generated at the non-AP STA, the frame is sent to its HC. In either case, the DELTS frame does not solicit a response from the recipient frame other than an acknowledgment to receipt of the frame.

6.3.26.7 MLME-DELTS.indication

6.3.26.7.1 Function

This primitive reports the deletion of a TS by a specified peer MAC entity or deletion of the TS due to an inactivity timeout (HC only).

6.3.26.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.indication(
    STAAddress,
    TSInfo,
    ReasonCode,
    VendorSpecificInfo
)
```
6.3.26.7.3 When generated

This primitive is generated by the MLME when it receives a DELTS frame from the specified peer MAC entity.

This primitive may also be generated by the MLME at the HC as a result of inactivity of a particular TS. Inactivity results when a period equal to the inactivity interval in the TSPEC for the TS elapses

- Without arrival of an MSDU belonging to that TS at the MAC entity of the HC via an MA-UNITDATA.request primitive when the HC is the source STA of that TS or
- Without reception of an MSDU belonging to that TS by the MAC entity of the HC when the HC is not the source STA of that TS.

This primitive is generated after any other state concerning the TSID/direction within the MAC has been destroyed.

6.3.26.7.4 Effect of receipt

The SME is notified of the initiation of a TS deletion by a specified peer MAC entity.

6.3.27 Management of direct links

6.3.27.1 Introduction

This subclause describes the management procedures associated with direct links.

6.3.27.2 MLME-DLS.request

6.3.27.2.1 Function

This primitive requests the setup of a direct link with a specified peer MAC entity.

6.3.27.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS.request(
    PeerMACAddress,
    DLSTimeoutValue,
    DLSResponseTimeout,
    VendorSpecificInfo
)
```
6.3.27.2.3 When generated

This primitive is generated by the SME at a STA to set up a direct link with another STA.

6.3.27.2.4 Effect of receipt

This primitive initiates a DLS procedure. The MLME subsequently issues an MLME-DLS.confirm primitive that reflects the results.

6.3.27.3 MLME-DLS.confirm

6.3.27.3.1 Function

This primitive reports the results of a DLS attempt with a specified peer MAC entity.

6.3.27.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLS.confirm(
    PeerMACAddress,
    ResultCode,
    CapabilityInformation,
    DLSTimeoutValue,
    SupportedRates,
    HT Capabilities,
    VendorSpecificInfo
)

<table>

</tbody>
</table>
6.3.27.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DLS.request primitive to establish a direct link with a specified peer MAC entity.

6.3.27.3.4 Effect of receipt

The SME is notified of the results of the DLS procedure.

6.3.27.4 MLME-DLS.indication

6.3.27.4.1 Function

This primitive reports the establishment of a direct link with a specified peer MAC entity.

6.3.27.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLS.indication(
              PeerMACAddress,
              CapabilityInformation,
              DLSTimeoutValue,
              SupportedRates,
              HT Capabilities,
              VendorSpecificInfo
          )

<table>
<thead>

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.27.4.3 When generated

This primitive is generated by the MLME as result of the establishment of a direct link with a specific peer MAC entity that resulted from a DLS procedure that was initiated by that specific peer MAC entity.

6.3.27.4.4 Effect of receipt

The SME is notified of the establishment of the DLS.

6.3.27.5 MLME-DLSTeardown.request

6.3.27.5.1 Function

When initiated by a non-AP STA, this primitive requests the teardown of the direct link with a specified peer MAC entity. When initiated by an AP, this primitive requests the teardown of direct link between two specified MAC entities.

6.3.27.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLSTeardown.request(
    PeerMACAddress1,
    PeerMACAddress2,
    ReasonCode,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>

<tr>
<td>PeerMACAddress2</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the STA with which the DLS is being torn down. This parameter is applicable only at the AP.</td>
</tr>
</tbody>
</table>
6.3.27.5.3 When generated

This primitive is generated by the SME at a STA for tearing down a direct link with another STA.

6.3.27.5.4 Effect of receipt

This primitive initiates a direct-link teardown procedure. The MLME subsequently issues an MLME-DLSTeardown.confirm primitive that reflects the results.

6.3.27.6 MLME-DLSTeardown.indication

6.3.27.6.1 Function

This primitive indicates the teardown of an already established direct link with a specific peer MAC entity.

6.3.27.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLSTeardown.indication(
PeerMACAddress,
ReasonCode,
VendorSpecificInfo
)

### Table: MLME-DLSTeardown.indication

<table>
<thead>
<tr>

<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.27.6.3 When generated

This primitive is generated by the MLME as result of the teardown of a direct link with a specific peer MAC entity that resulted from a direct link teardown procedure that was initiated either by that specific peer MAC entity or by the local MAC entity.

6.3.27.6.4 Effect of receipt

The SME is notified of the teardown of the DLS.
6.3.28 Higher layer synchronization support

6.3.28.1 Introduction

This mechanism supports the process of synchronization among higher layer protocol entities residing within different wireless STAs. The actual synchronization mechanism in the higher layer is out of the scope of this standard. In principle, the MLME indicates the transmission/reception of frames with a specific group address in the Address 1 field of a data MPDU.

6.3.28.2 MLME-HL-SYNC.request

6.3.28.2.1 Function

This primitive requests activation of the synchronization support mechanism.

6.3.28.2.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-HL-SYNC.request(GroupAddress)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupAddress</td>
<td>MACAddress</td>
<td>A group MAC address</td>
<td>Specifies the group MAC address to which the synchronization frames are addressed. A synchronization frame is a data frame with higher layer synchronization information.</td>
</tr>
</tbody>
</table>

6.3.28.2.3 When generated

This primitive is generated by the SME when a higher layer protocol initiates a synchronization process.

6.3.28.2.4 Effect of Receipt

This request activates the synchronization support mechanism at the STA. The MLME issues an MLME-HL-SYNC.indication primitive when a higher layer synchronization frame, which is a data frame with the specified group address in Address 1 field, is received or transmitted.

6.3.28.3 MLME-HL-SYNC.indication

6.3.28.3.1 Function

This primitive indicates the last symbol on air of a higher layer synchronization frame, whether transmitted or received by the MAC.

6.3.28.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-HL-SYNC.indication(SourceAddress, SequenceNumber)}
\]
6.3.28.3.3 When generated

This primitive is generated by the MLME when the successful reception or transmission of a higher layer synchronization frame is detected, as indicated by the PHY_RXEND.indication or PHY_TXEND.confirm primitives generated by the PHY. The higher layer synchronization frame is identified by the group MAC address registered by an earlier MLME-HL-SYNC.request primitive in the Address 1 field of a data frame.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SourceAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the SA of the STA that transmitted the higher layer synchronization frame.</td>
</tr>
<tr>
<td>SequenceNumber</td>
<td>Integer</td>
<td>As defined in 8.2.4.4.2</td>
<td>Specifies the sequence number of the higher layer synchronization frame received or transmitted.</td>
</tr>
</tbody>
</table>

6.3.28.3.4 Effect of Receipt

The SME is notified of the reception or transmission of a higher layer synchronization frame.

6.3.29 Block Ack

6.3.29.1 General

This mechanism supports the initiation (or modification) and termination of Block Ack.

The primitives used for this mechanism are called Block Ack primitives, which include MLME-ADDBA.xxx and MLME-DELBA.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a Block Ack Action frame body. Requests and responses may cause these frames to be sent. Confirms and indications are emitted when an appropriate Block Ack Action frame is received.

6.3.29.2 MLME-ADDBA.request

6.3.29.2.1 Function

This primitive requests the initiation (or modification) of Block Ack with a peer MAC entity.

6.3.29.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-ADDBA.request(
    PeerSTAAddress,
    DialogToken,
    TID,
    BlockAckPolicy,
    BufferSize,
    BlockAckTimeout,
    ADDDBAFailureTimeout,
    BlockAckStartingSequenceControl,
    VendorSpecificInfo
)
```
6.3.29.3.1 Function

The primitive reports the results of initiation (or modification) of the Block Ack attempt with the specified peer MAC entity.

6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ADDBA.confirm}( \text{PeerSTAAddress}, \text{DialogToken}, \text{TID}, \text{ResultCode}, \text{BlockAckPolicy}, \text{BufferSize}, \text{BlockAckTimeout}, \text{VendorSpecificInfo} )
\]

6.3.29.3 MLME-ADDBA.confirm

### 6.3.29.3.1 Function

The primitive reports the results of initiation (or modification) of the Block Ack attempt with the specified peer MAC entity.

### 6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ADDBA.confirm}( \text{PeerSTAAddress}, \text{DialogToken}, \text{TID}, \text{ResultCode}, \text{BlockAckPolicy}, \text{BufferSize}, \text{BlockAckTimeout}, \text{VendorSpecificInfo} )
\]

---

### 6.3.29.2.3 When generated

This primitive is generated by the SME at a STA to request initiation (or modification) of Block Ack with the specified peer MAC entity.

### 6.3.29.2.4 Effect of receipt

The STA sends the ADDBA Request frame to the specified peer MAC entity.

---

### 6.3.29.3 MLME-ADDBA.confirm

### 6.3.29.3.1 Function

The primitive reports the results of initiation (or modification) of the Block Ack attempt with the specified peer MAC entity.

### 6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ADDBA.confirm}( \text{PeerSTAAddress}, \text{DialogToken}, \text{TID}, \text{ResultCode}, \text{BlockAckPolicy}, \text{BufferSize}, \text{BlockAckTimeout}, \text{VendorSpecificInfo} )
\]
6.3.29.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.request primitive to indicate the results of that request.

6.3.29.3.4 Effect of receipt

The SME is notified of the results of the Block Ack initiation (or modification).

6.3.29.4 MLME-ADDBA.indication

6.3.29.4.1 Function

This primitive reports the initiation (or modification) of Block Ack by a peer MAC entity.

6.3.29.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.indication(
    PeerSTAAddress,  
    DialogToken,     
    TID,             
    BlockAckPolicy,  
    BufferSize,      
    BlockAckTimeout, 
    VendorSpecificInfo
)
```
6.3.29.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a Block Ack initiation (or modification) by the specified peer MAC entity in the form of an ADDBA Request frame.

6.3.29.4.4 Effect of receipt

The SME is notified of the initiation (or modification) of the Block Ack by the specified peer MAC entity.

6.3.29.5 MLME-ADDBA.response

6.3.29.5.1 Function

The primitive responds to the initiation (or modification) by a specified peer MAC entity.

6.3.29.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.response(
    PeerSTAAddress,
    DialogToken,
    TID,
    ResultCode,
    BlockAckPolicy,
    BufferSize,
    BlockAckTimeout,
    VendorSpecificInfo
)

<table>
<thead>
<tr>

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>N/A</td>
<td>Specifies the address of the peer MAC entity that attempted the Block Ack initiation (or modification). This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.indication primitive.</td>
</tr>
</tbody>
</table>
6.3.29.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.indication primitive to initiate Block Ack by the specified peer MAC entity.

6.3.29.5.4 Effect of receipt

The primitive causes the MAC entity to send an ADDBA Response frame to the specified peer MAC entity.

6.3.29.6 MLME-DELBA.request

6.3.29.6.1 Function

This primitive requests the deletion of Block Ack with a peer MAC entity.

6.3.29.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELBA.request(  
    PeerSTAAddress,  
    Direction,  
    TID,  
    ReasonCode,  
    VendorSpecificInfo  
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>

6.3.29.6.3 When generated

This primitive is generated by the SME at a STA to request deletion of Block Ack with the specified peer MAC entity.

6.3.29.6.4 Effect of receipt

The STA sends the DELBA frame to the specified peer MAC entity.

6.3.29.7 MLME-DELBA.indication

6.3.29.7.1 Function

This primitive reports the deletion of Block Ack by a peer MAC entity.

6.3.29.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELBA.indication( 
PeerSTAAddress, 
Direction, 
TID, 
ReasonCode, 
VendorSpecificInfo )

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.29.7.3 When generated

This primitive is generated by the MLME as a result of receipt of a Block Ack deletion by the specified peer MAC entity in the form of a DELBA frame.

6.3.29.7.4 Effect of receipt

The SME is notified of the deletion of the Block Ack by the specified peer MAC entity.

6.3.30 Schedule element management

6.3.30.1 Introduction

This subclause describes the management procedures associated with the QoS Schedule element.

The primitives defined are MLME-SCHEDULE.request and MLME-SCHEDULE.indication.

6.3.30.2 MLME-SCHEDULE.request

6.3.30.2.1 Function

This primitive requests transmission of a Schedule frame. It is valid at the HC.

6.3.30.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-SCHEDULE.request(}
\begin{align*}
\text{STAAddress}, \\
\text{Schedule}
\end{align*}
\)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAAddress</td>
<td>MACAddress</td>
<td>Any valid individual address</td>
<td>MAC address of the STA to which the Schedule frame shall be sent.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule element</td>
<td>As defined in 8.4.2.36</td>
<td>Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval.</td>
</tr>
</tbody>
</table>

6.3.30.2.3 When generated

This primitive is generated by the SME at the HC to send the schedule information, in the form of a Schedule frame, to a specified STA when the schedule information for the STA is changed.

6.3.30.2.4 Effect of receipt

This primitive causes the MAC entity at the HC to send a Schedule frame to the STA specified in the primitive containing the specified Schedule parameters.

6.3.30.3 MLME-SCHEDULE.indication

6.3.30.3.1 Function

This primitive reports the reception of a new schedule by the STA in the form of a Schedule frame.
6.3.30.3.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SCHEDULE.indication(
  Schedule
)

6.3.30.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a new schedule in the form of a Schedule frame.

6.3.30.3.4 Effect of receipt

The SME is notified of the receipt of QoS schedule in the form of a Schedule frame. The new Schedule parameters overwrite the previously stored values.

6.3.31 Vendor-specific action

6.3.31.1 Introduction

This set of primitives supports the signaling of (Protected) Vendor Specific Action frames among peer SMEs.

6.3.31.2 MLME-VSPECIFIC.request

6.3.31.2.1 Function

This primitive requests transmission of a Vendor Specific Action frame.

6.3.31.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-VSPECIFIC.request(
  PeerMACAddress,
  Protected,
  Organization Identifier,
  VendorSpecificContent
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address or any valid group MAC address</td>
<td>The address of the peer MAC entity or group of entities to which the Vendor Specific Action frame is sent.</td>
</tr>
</tbody>
</table>
6.3.31.2.3 When generated

This primitive is generated by the SME to request that a Vendor Specific Action frame be sent.

6.3.31.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Vendor Specific Action frame containing the set of elements and vendor-specific fields. The STA then attempts to transmit the frame.

6.3.31.3 MLME-VSPECIFIC.indication

6.3.31.3.1 Function

This primitive indicates that a Vendor Specific Action frame has been received from a peer entity.

6.3.31.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-VSPECIFIC.indication(}
\text{PeerMACAddress,}
\text{Protected,}
\text{Organization Identifier,}
\text{RCPI,}
\text{VendorSpecificContent}
\]

<table>

</tr>
</tbody>
</table>
6.3.31.3.3 When generated

This primitive is generated by the MLME when a valid Vendor Specific Action frame is received.

6.3.31.3.4 Effect of receipt

On receipt of this primitive, the Vendor Specific Content can be made available for SME processes.

6.3.32 Neighbor report request

6.3.32.1 General

The following MLME primitives support the signaling of neighbor report requests.

6.3.32.2 MLME-NEIGHBORREPREQ.request

6.3.32.2.1 Function

This primitive requests that a Neighbor Report Request frame be sent to the AP with which the STA is associated. It is valid only at a Radio Measurement capable STA.

6.3.32.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-NEIGHBORREPREQ.request(
    DialogToken,
    SSID,
    VendorSpecificInfo
)
```
### 6.3.32.2.3 When generated

This primitive is generated by the SME to request that a Neighbor Report Request frame be sent to the AP with which the STA is associated to request a neighbor report.

### 6.3.32.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Request frame. The STA then attempts to transmit this to the AP with which it is associated.

### 6.3.32.3 MLME-NEIGHBORREPREQ.indication

#### 6.3.32.3.1 Function

This primitive indicates that a Neighbor Report Request frame was received. It is valid only at a Radio Measurement capable AP.

#### 6.3.32.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-NEIGHBORREPREQ.indication(
    PeerSTAAddress,
    DialogToken,
    SSID,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>

</tr>
<tr>
<td>SSID</td>
<td>As defined in the SSID element</td>
<td>As defined in the SSID element</td>
<td>Optional SSID element to request a neighbor list for a specific SSID.</td>
</tr>
<tr>
<td>Vendor-SpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

#### 6.3.32.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Request frame is received.

---

Copyright © 2012 IEEE. All rights reserved.
6.3.32.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.11.10.3.

6.3.33 Neighbor report response

6.3.33.1 General

The following MLME primitives support the signaling of neighbor report responses.

6.3.33.2 MLME-NEIGHBORREPRESP.request

6.3.33.2.1 Function

This primitive requests that a neighbor report response be sent. This may be in response to an MLME-NEIGHBORREPREQ.indication primitive or an autonomous request. It is valid only at a Radio Measurement capable AP.

6.3.33.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPRESP.request(
    PeerSTAAddress, DialogToken, NeighborListSet, VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>The address of the STA’s MAC entity to which a Neighbor Report Response frame is to be sent.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The Dialog Token to identify the neighbor report transaction. Set to the value received in the corresponding MLME-NEIGHBORREPREQ.indication primitive or to 0 for an autonomous report.</td>
</tr>
<tr>
<td>NeighborListSet</td>
<td>Set of Neighbor List elements each as defined in the Neighbor Report element format</td>
<td>As defined in 8.4.2.39</td>
<td>A set of Neighbor List elements, each representing a neighboring AP being reported as defined in the Neighbor Report element format.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.33.2.3 When generated

This primitive is generated by the SME to request a neighbor report be sent. This may be in response to an earlier MLME-NEIGHBORREPREQ.indication primitive or a request to transmit an autonomous report.
6.3.33.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.33.3 MLME-NEIGHBORREPRESP.indication

6.3.33.3.1 Function

This primitive indicates that a neighbor report response has been received. This may be in response to an earlier neighbor report request (MLME-NEIGHBORREPREQ.request) or an autonomous report. It is valid only at a Radio Measurement capable STA.

6.3.33.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPRESP.indication(
    PeerSTAAddress,
    DialogToken,
    NeighborListSet,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>The address of the AP from which the Neighbor Report Response frame was received.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The Dialog Token received in the Neighbor Report Response frame to identify the neighbor report transaction.</td>
</tr>
<tr>
<td>NeighborListSet</td>
<td>Set of Neighbor List elements, each as defined in the Neighbor Report element format</td>
<td>As defined in 8.4.2.39</td>
<td>A set of Neighbor List elements derived from the MIB table dot11RMNeighborReportTable, each representing a neighboring AP being reported as defined in the Neighbor Report element format.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.33.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Response frame is received.

6.3.33.3.4 Effect of receipt

On receipt of this primitive, neighbor report data may be available to the SME.

6.3.34 Link Measure Request

6.3.34.1 General

The following primitives support the measurement of link path loss and the estimation of link margin between peer entities.
6.3.34.2 MLME-LINKMEASURE.request

6.3.34.2.1 Function

This primitive supports the measurement of link path loss and the estimation of link margin between peer entities.

NOTE—The layer management model used assumes that the handling of a received Link Measurement Request frame is entirely within the MLME. Correspondingly there are no MLME-SME primitives specified for the peer side of a link measurement request transaction.

6.3.34.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LINKMEASURE.request(
    PeerMACAddress, DialogToken, Transmit Power, Max Transmit Power, VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>The address of the peer MAC entity to which the Link Measure Request shall be sent.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the Link Measurement transaction.</td>
</tr>
<tr>
<td>Transmit Power</td>
<td>Integer</td>
<td>As defined in 8.5.7.4</td>
<td>The transmit power to be used when transmitting the Link Measurement Request frame and included in the frame body. See 8.5.7.4.</td>
</tr>
<tr>
<td>Max Transmit Power</td>
<td>Integer</td>
<td>As defined in 8.5.7.4</td>
<td>The maximum transmit power to be used by the transmitting STA on its operating channel. See 8.5.7.5.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.34.2.3 When generated

This primitive is generated by the SME to request that a Link Measurement Request frame be sent to the peer entity to request that entity to report transmit power and link margin information.

6.3.34.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Link Measurement Request frame. The STA then attempts to transmit this to the STA indicated in the PeerMACAddress parameter.

6.3.34.3 MLME-LINKMEASURE.confirm

6.3.34.3.1 Function

This primitive reports the result of a Link Measurement request.

6.3.34.3.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME-LINKMEASURE.confirm(
  ResultCode,
  DialogToken,
  TransmitPower,
  LinkMargin,
  RCPI.request,
  RSNI.request,
  RCPI.report,
  RSNI.report,
  ReceiveAntennaID,
  TransmitAntennaID,
  VendorSpecificInfo
)

<table>
<thead>

<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.34.3.3 When generated

This primitive is generated by the MLME when a valid Link Measurement Report frame is received from the requested STA.

6.3.34.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the ResultCode and may use the reported data.

6.3.35 MLME SAP interface for resource request

6.3.35.1 MLME-RESOURCE-REQUEST.request

6.3.35.1.1 Function

This primitive is used to perform the over-the-air resource request of an FT Resource Request Protocol. The over-the-air resource request is performed using Authentication frames, with an authentication algorithm of FT authentication and transaction sequence number of 3 or 4.

6.3.35.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-RESOURCE-REQUEST.request(}
\text{PeerMACAddress,}
\text{Contents of FT Authentication elements}
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the AP that is the intended immediate recipient of the resource request.</td>
</tr>
<tr>
<td>Content of FT Authentication elements</td>
<td>Sequence of elements</td>
<td>As defined in 12.8</td>
<td>The set of elements to be included in the FT Confirm frame, as described in 12.8.4.</td>
</tr>
</tbody>
</table>

6.3.35.1.3 When generated

This primitive is generated by the SME to send the third frame of the over-the-air FT Resource Request Protocol. The third frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 3.

6.3.35.1.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.2 MLME-RESOURCE-REQUEST.indication

6.3.35.2.1 Function

This primitive is used to enact the security and QoS resource request with a specified peer MAC entity.

6.3.35.2.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME-RESOURCE-REQUEST.indication(
    PeerMACAddress,
    Content of FT Authentication elements
)

6.3.35.2.3 When generated

This primitive is generated by the MLME at an AP to indicate that the third frame of the over-the-air FT Resource Request Protocol has been received. The third frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 3.

6.3.35.2.4 Effect of receipt

Upon receipt of this primitive, the SME examines the Transition element and RSNE contents and responds to the peer MAC address using the MLME-RESOURCE-REQUEST.response primitive.

6.3.35.3 MLME-RESOURCE-REQUEST.response

6.3.35.3.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESOURCE-REQUEST.response(
    PeerMACAddress,
    Content of FT Authentication elements
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the STA that was the sender of the resource request.</td>
</tr>
<tr>
<td>Content of FT Authentication</td>
<td>Sequence of elements</td>
<td>As defined in 12.8</td>
<td>The set of elements included in the FT Confirm frame, as described in 12.8.4.</td>
</tr>
</tbody>
</table>

6.3.35.3.3 When generated

This primitive is generated by the SME at an AP to cause the transmission of the fourth frame in the over-the-air FT Resource Request Protocol. The fourth frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 4.
6.3.35.3.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.4 MLME-RESOURCE-REQUEST.confirm

6.3.35.4.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-RESOURCE-REQUEST.confirm(} \\
\quad \text{PeerMACAddress,} \\
\quad \text{Content of FT Authentication elements} \\
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the AP that was the sender of the resource response.</td>
</tr>
<tr>
<td>Content of FT Authentication elements</td>
<td>Sequence of elements</td>
<td>As defined in 12.8</td>
<td>The set of elements included in the FT Ack frame, as described in 12.8.5. This includes an optional response to a resource request (RIC).</td>
</tr>
</tbody>
</table>

6.3.35.4.3 When generated

This primitive is generated by the MLME on receipt of the fourth frame in the FT Resource Request Protocol.

6.3.35.4.4 Effect of receipt

Upon receipt of this primitive, the SME examines the content of the message and completes its processing of the resource request.

6.3.35.5 MLME-RESOURCE-REQUEST-LOCAL.request

6.3.35.5.1 Function

This primitive is used to enact the over-the-DS FT Resource Request Protocol for a specified peer MAC entity. The over-the-DS FT Resource Request Protocol is performed by communication between the STA and the SME of the target AP, bypassing the MAC of the target AP. This MLME function is used to allow the MAC of the target AP to process the resource requests.

6.3.35.5.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-RESOURCE-REQUEST-LOCAL.request(} \\
\quad \text{MACAddress,} \\
\quad \text{Content of Resource Descriptor(s)} \\
\text{)}
\]
6.3.35.3 When generated

This primitive is generated by the SME at a target AP upon receiving an over-the-DS resource request to request resources within the local MAC.

6.3.35.4 Effect of receipt

Upon receipt of this primitive, the MAC checks for resource availability and allocates resources as requested.

6.3.35.6 MLME-RESOURCE-REQUEST-LOCAL.confirm

6.3.35.6.1 Function

This primitive is used to respond to a local resource request for resources from the SME.

6.3.35.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESOURCE-REQUEST-LOCAL.confirm(

MACAddress,
Content of Resource Descriptor(s),
ResultCode
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the STA that is making the resource request.</td>
</tr>
<tr>
<td>Content of Resource</td>
<td>Sequence of elements</td>
<td>As defined in 12.11.2</td>
<td>Specifies the resource(s) that are being requested.</td>
</tr>
<tr>
<td>Descriptor(s)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, REFUSED, UNSPECIFIED, FAILURE</td>
<td>Indicates the result of the outcome of a resource request.</td>
</tr>
</tbody>
</table>

6.3.35.6.3 When generated

This primitive is generated by the MAC in response to a local resource request for resources via MLME-RESOURCE-REQUEST-LOCAL.request primitive.

6.3.35.6.4 Effect of receipt

Upon receipt of this primitive, the SME prepares a success or failure response to be sent to the STA via the current AP.
6.3.36 MLME SAP interface for remote requests

6.3.36.1 MLME-REMOTE-REQUEST.request

6.3.36.1.1 Function

This primitive is used by the SME of a non-AP STA (to send over-the-DS requests) and the SME of an AP (to send over-the-DS responses) to request the MAC to send an FT Action frame.

6.3.36.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-REMOTE-REQUEST.request(}
\begin{align*}
\text{PeerMACAddress,} \\
\text{Content of FT Action Frame}
\end{align*}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the STA that is the destination of the Action frame</td>
</tr>
<tr>
<td>Content of FT Action Frame</td>
<td>Sequence of octets</td>
<td>As defined in 8.5.9</td>
<td>The Action frame to send to the STA.</td>
</tr>
</tbody>
</table>

6.3.36.1.3 When generated

This primitive is generated by the SME to send an FT Action frame to a specific peer MAC entity.

6.3.36.1.4 Effect of receipt

Upon receipt of this primitive, the MAC forwards the Action frame to the STA identified in the Action frame.

6.3.36.2 MLME-REMOTE-REQUEST.indication

6.3.36.2.1 Function

This primitive is used by the MAC to indicate to the SME the reception of an FT Action frame.

6.3.36.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-REMOTE-REQUEST.indication(}
\begin{align*}
\text{PeerMACAddress,} \\
\text{Contents of FT Action Frame}
\end{align*}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the STA that issued the Action frame.</td>
</tr>
<tr>
<td>Content of FT Action Frame</td>
<td>Sequence of octets</td>
<td>As defined in 8.5.9</td>
<td>The Action frame received from the STA.</td>
</tr>
</tbody>
</table>
6.3.36.2.3 When generated

This primitive is generated by the MAC as a result of the receipt of an FT Action frame from a specific peer MAC entity.

6.3.36.2.4 Effect of receipt

Upon receipt of this primitive, the remote request broker (RRB) in the SME of the current AP forwards the Action frame to the target AP identified in the Action frame.

6.3.37 Extended channel switch announcement

6.3.37.1 General

The following MLME primitives support the signaling of extended channel switch announcement.

6.3.37.2 MLME-EXTCHANNELSWITCH.request

6.3.37.2.1 Function

This primitive requests that a (Protected) Extended Channel Switch Announcement frame be sent by an AP or mesh STA in an MBSS.

6.3.37.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-EXTCHANNELSWITCH.request(
    Mode, OperatingClass, ChannelNumber, ChannelSwitchCount, Protected,
    Mesh Channel Switch Parameters, VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Integer</td>
<td>0,1</td>
<td>Channel switch mode, as defined for the Extended Channel Switch Announcement element.</td>
</tr>
<tr>
<td>OperatingClass</td>
<td>Integer</td>
<td>As defined in Annex E</td>
<td>Specifies the new operating class.</td>
</tr>
<tr>
<td>ChannelNumber</td>
<td>Integer</td>
<td>As defined in Annex E</td>
<td>Specifies the new channel number.</td>
</tr>
<tr>
<td>ChannelSwitchCount</td>
<td>As defined in 8.4.2.55</td>
<td>As defined in 8.4.2.55</td>
<td>Specifies the time period until the channel switch event, as described in 8.4.2.55</td>
</tr>
<tr>
<td>Protected</td>
<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using the Protected Extended Channel Switch Announcement frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If false, the request is sent using the Extended Channel Switch Announcement frame.</td>
</tr>
</tbody>
</table>

Copyright © 2012 IEEE. All rights reserved.
6.3.37.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) Extended Channel Switch Announcement frame be sent to a STA that is associated to the AP or to peer mesh STAs in the MBSS.

6.3.37.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) Extended Channel Switch Announcement frame.

6.3.37.3 MLME-EXTCHANNELSWITCH.confirm

6.3.37.3.1 Function

This primitive reports the result of a request to switch channel.

6.3.37.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.confirm(
    ResultCode,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, UNSPECIFIED_FAILURE</td>
<td>Reports the result of an extended channel switch request.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.37.3.3 When generated

This primitive is generated by the MLME when an extended channel switch request completes. Possible unspecified failure causes include an inability to schedule an extended channel switch announcement.

6.3.37.3.4 Effect of receipt

The SME is notified of the results of the extended channel switch procedure.
6.3.37.4 MLME-EXTCHANNELSWITCH.indication

6.3.37.4.1 Function

This primitive indicates that a (Protected) Extended Channel Switch Announcement frame was received from an AP or from a peer mesh STA.

6.3.37.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EXTCHANNELSWITCH.indication(
  Peer MAC Address,
  Mode,
  OperatingClass,
  ChannelNumber,
  ChannelSwitchCount,
  Protected,
  Mesh Channel Switch Parameters,
  VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>

</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.37.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) Extended Channel Switch Announcement frame is received.
6.3.37.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch request.

6.3.37.5 MLME-EXTCHANNELSWITCH.response

6.3.37.5.1 Function

This primitive is used to schedule an accepted extended channel switch.

6.3.37.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-EXTCHANNELSWITCH.response(
    Mode,
    OperatingClass,
    ChannelNumber,
    ChannelSwitchCount,
    Mesh Channel Switch Parameters,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Integer</td>
<td>0, 1</td>
<td>Channel switch mode, as defined for the Channel Switch Announcement element.</td>
</tr>
<tr>
<td>OperatingClass</td>
<td>Integer</td>
<td>As defined in Annex E</td>
<td>Specifies the new operating class.</td>
</tr>
<tr>
<td>ChannelNumber</td>
<td>Integer</td>
<td>As defined in Annex E</td>
<td>Specifies the new channel number.</td>
</tr>
<tr>
<td>ChannelSwitchCount</td>
<td>As defined in 8.4.2.55</td>
<td>As defined in 8.4.2.55</td>
<td>Specifies the time period until the channel switch event, as described in 8.4.2.55</td>
</tr>
<tr>
<td>Mesh Channel Switch Parameters</td>
<td>As defined in 8.4.2.105</td>
<td>As defined in 8.4.2.105</td>
<td>Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.37.5.3 When generated

This primitive is generated by the SME to schedule an accepted extended channel switch request.

6.3.37.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the extended channel switch.

6.3.38 DSE power constraint announcement

6.3.38.1 General

The following MLME primitives support the signaling of DSE power constraint to dependent STAs.
6.3.38.2 MLME-DSETPC.request

6.3.38.2.1 Function

This primitive requests that a (Protected) DSE Power Constraint frame be sent by an enabling STA.

6.3.38.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DSETPC.request(
    RequesterSTAAddress,
    ResponderSTAAddress,
    DSELocalPowerConstraint,
    Protected,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequesterSTAAddress</td>
<td>MACAddress</td>
<td>Any valid</td>
<td>Specifies the address of the MAC entity of the enabling STA.</td>
</tr>
<tr>
<td>ResponderSTAAddress</td>
<td>MACAddress</td>
<td>Any valid</td>
<td>Specifies the address of the MAC entity that initiates the enablement process.</td>
</tr>
<tr>
<td>DSELocalPowerConstraint</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the local power constraint, as described in the DSE Power Constraint frame (see 8.5.8.10).</td>
</tr>
<tr>
<td>Protected</td>
<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the request is sent using a Robust Management frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If true, the request is sent using the Protected DSE Power Constraint frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If false, the request is sent using the DSE Power Constraint frame.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.38.2.3 When generated

This primitive is generated by the SME to request that a (Protected) DSE Power Constraint Announcement frame be sent to a dependent STA.

6.3.38.2.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs a (Protected) DSE Power Constraint Announcement frame. The enabling STA then schedules this frame for transmission.

6.3.38.3 MLME-DSETPC.confirm

6.3.38.3.1 Function

This primitive reports the results of a request to send a (Protected) DSE Power Constraint Announcement frame.
6.3.38.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.confirm(
    ResultCode,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, REFUSED</td>
<td>Indicates the result of MLME-DSETPC.request primitive.</td>

<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.38.3.3 When generated

This primitive is generated by the MLME when a DSE power constraint announcement completes.

6.3.38.3.4 Effect of receipt

The SME is notified of the results of the DSE power constraint procedure.

6.3.38.4 MLME-DSETPC.indication

6.3.38.4.1 Function

This primitive indicates that a DSE Power Constraint Announcement frame was received from an enabling STA.

6.3.38.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.indication(
    RequesterSTAAddress,
    ResponderSTAAddress,
    DSELocalPowerConstraint,
    Protected,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequesterSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity that initiated the enablement process.</td>
</tr>
<tr>
<td>ResponderSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity that is the enabling STA.</td>
</tr>
<tr>
<td>DSELocalPowerConstraint</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the local power constraint, as described in the DSE Power Constraint frame (see 8.5,8.10).</td>
</tr>
</tbody>
</table>
6.3.38.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) DSE Power Constraint Announcement frame is received.

6.3.38.4.4 Effect of receipt

On receipt of this primitive, the SME performs the DSE power constraint procedure (see 10.12.5).

6.3.38.5 MLME-DSETPC.response

6.3.38.5.1 Function

This primitive is used to report the result of the DSE power constraint procedure.

6.3.38.5.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DSETPC.response(}
\text{RequesterSTAAddress,}
\text{ResponderSTAAddress,}
\text{ResultCode,}
\text{Protected,}
\text{VendorSpecificInfo}
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequesterSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the MAC entity of the enabling STA.</td>
</tr>
<tr>
<td>ResponderSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity that initiates the enabling process.</td>
</tr>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, REFUSED</td>
<td>Reports the result of a DSE power constraint procedure.</td>
</tr>
<tr>
<td>Protected</td>
<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the response is sent using a Robust Management frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If true, the response is sent using the Protected DSE Power Constraint frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If false, the response is sent using the DSE Power Constraint frame.</td>
</tr>
</tbody>
</table>
6.3.38.5.3 When generated

This primitive is generated by the SME to schedule a response to DSE power constraint announcement.

6.3.38.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the transmission of a (Protected) DSE power constraint result to the enabling STA that sent the DSE power constraint announcement.

6.3.39 Enablement

6.3.39.1 General

This mechanism supports the process of establishing an enablement relationship with a peer MAC entity.

6.3.39.2 MLME-ENABLEMENT.request

6.3.39.2.1 Function

This primitive requests enablement with a specified peer MAC entity.

6.3.39.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ENABLEMENT.request(}
\begin{array}{l}
\text{RequesterSTAAddress,} \\
\text{ResponderSTAAddress,} \\
\text{EnablementTimeLimit,} \\
\text{Protected,} \\
\text{VendorSpecificInfo}
\end{array}
\)\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>

</tbody>
</table>
6.3.39.2.3 When generated

This primitive is generated by the SME for a STA to establish enablement with a specified peer MAC entity. During the enablement procedure, the SME can generate additional MLME-ENABLEMENT.request primitives.

6.3.39.2.4 Effect of receipt

This primitive initiates an enablement procedure. The MLME subsequently issues a MLME-ENABLEMENT.confirm primitive that reflects the results.

6.3.39.3 MLME-ENABLEMENT.confirm

6.3.39.3.1 Function

This primitive reports the results of an enablement attempt with a specified peer MAC entity.

6.3.39.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-ENABLEMENT.confirm(}
\begin{align*}
\text{RequesterSTAAddress,} \\
\text{ResponderSTAAddress,} \\
\text{ResultCode,} \\
\text{Protected,} \\
\text{EnablementIdentifier,} \\
\text{VendorSpecificInfo}
\end{align*}
\)

</table>
6.3.39.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ENABLEMENT.request primitive for enablement with a specified peer MAC entity.

6.3.39.3.4 Effect of receipt

The SME is notified of the results of the enablement procedure.

6.3.39.4 MLME-ENABLEMENT.indication

6.3.39.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an enablement relationship with the STA processing this primitive.

6.3.39.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.indication(
RequesterSTAAddress,
ResponderSTAAddress,
Protected,
VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>

</tr>
</tbody>
</table>
6.3.39.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an enablement request from a specific peer MAC entity.

6.3.39.4.4 Effect of receipt

The SME is notified of the receipt of this enablement request.

6.3.39.5 MLME-ENABLEMENT.response

6.3.39.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested enablement with the STA that issued this primitive.

6.3.39.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ENABLEMENT.response(
    RequesterSTAAddress,  
    ResponderSTAAddress,  
    ResultCode,  
    EnablementIdentifier,  
    Protected,  
    VendorSpecificInfo  
)
```

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If false, the response is sent using the DSE Enablement frame.</td>
</tr>
</tbody>
</table>
6.3.39.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-ENABLEMENT.indication primitive.

6.3.39.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested enablement.

6.3.40 Deenablement

6.3.40.1 MLME-DEENABLEMENT.request

6.3.40.1.1 Function

This primitive requests that the enablement relationship with a specified peer MAC entity be invalidated.

6.3.40.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.request(
    RequesterSTAAddress,
    ResponderSTAAddress,
    ReasonCode,
    Protected,
    VendorSpecificInfo
)
```

<table>

<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.40.1.3 When generated

This primitive is generated by the SME for a STA to invalidate enablement with a specified peer MAC entity in order to prevent the exchange of (Protected dual of) Public Action frames between the two STAs. During the deenablement procedure, the SME can generate additional MLME-DEENABLEMENT.request primitives.

6.3.40.1.4 Effect of receipt

This primitive initiates a deenablement procedure.

6.3.40.2 MLME-DEENABLEMENT.indication

6.3.40.2.1 Function

This primitive reports the invalidation of an enablement relationship with a specified peer MAC entity.

6.3.40.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DEENABLEMENT.indication}(\text{RequesterSTAAddress, ResponderSTAAddress, ReasonCode, Protected, VendorSpecificInfo})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequesterSTAAdd</td>

<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the request was received using a Robust Management frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If true, the request was received using the Protected DSE Deenablement frame.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If false, the request was received using the DSE Deenablement frame.</td>
</tr>
<tr>
<td>VendorSpecificInf</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.40.2.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an enablement relationship with a specific peer MAC entity.
6.3.40.2.4 Effect of receipt

The SME is notified of the invalidation of the specific enablement relationship.

6.3.41 SA Query support

6.3.41.1 MLME-SAQuery.request

6.3.41.1.1 Function

This primitive requests that a SA Query Request frame be sent to a specified peer STA to which the STA is associated.

6.3.41.1.2 Semantics of the service primitive

The primitive parameters are as follows:
```plaintext
MLME-SAQuery.request(
    PeerSTAAddress,
    TransactionIdentifier
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTA Address</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity for the SA Query</td>
</tr>
<tr>
<td>TransactionIdentifier</td>
<td>2 octets</td>
<td>As defined in 8.5.10.2</td>
<td>The Transaction Identifier to identify the SA Query Request and Response transaction</td>
</tr>
</tbody>
</table>

6.3.41.1.3 When generated

This primitive is generated by the SME to request that a SA Query Request frame be sent to a specified peer STA with which the STA is associated.

6.3.41.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Request frame. The STA then attempts to transmit this to the peer STA with which it is associated.

6.3.41.2 MLME-SAQuery.confirm

6.3.41.2.1 Function

This primitive reports the result of a SA Query procedure.

6.3.41.2.2 Semantics of the service primitive

The primitive parameters are as follows:
```plaintext
MLME-SAQuery.confirm(
    PeerSTAAddress,
    TransactionIdentifier
)
```
6.3.41.2.3 When generated

This primitive is generated by the MLME as a result of the receipt of a valid SA Query Response frame.

6.3.41.2.4 Effect of receipt

On receipt of this primitive, the SME may use the response as a sign of liveness of the peer STA.

6.3.41.3 MLME-SAQuery.indication

6.3.41.3.1 Function

This primitive indicates that a SA Query Request frame was received from a STA.

6.3.41.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-SAQuery.indication}(\text{PeerSTAAddress}, \text{TransactionIdentifier})
\]

6.3.41.3.3 When generated

This primitive is generated by the MLME when a valid SA Query Request frame is received.

6.3.41.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.3.

6.3.41.4 MLME-SAQuery.response

6.3.41.4.1 Function

This primitive is generated in response to an MLME-SAQuery.indication requesting a SA Query Response frame be sent to a STA.

6.3.41.4.2 Semantics of the service primitive

The primitive parameters are as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity for the SA Query</td>
</tr>
<tr>
<td>TransactionIdentifier</td>
<td>2 octets</td>
<td>As defined in 8.5.10.2</td>
<td>The Transaction Identifier to identify the SA Query Request and Response transaction</td>
</tr>
</tbody>
</table>
MLME-SAQuery.response(
    PeerSTAAddress,
    TransactionIdentifier
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTA Address</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity for the SA Query</td>
</tr>
<tr>
<td>TransactionIdentifier</td>
<td>2 octets</td>
<td>As defined in 8.5.10.2</td>
<td>The Transaction Identifier to identify the SA Query Request and Response transaction</td>
</tr>
</tbody>
</table>

6.3.41.4.3 When generated

This primitive is generated by the SME, in response to an MLME-SAQuery.indication primitive, requesting a SA Query Response frame be sent to a STA.

6.3.41.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.42 Get TSF timer

6.3.42.1 General

This mechanism is used to request the current value of the TSF timer that the STA maintains.

6.3.42.2 MLME-GETTSFTIME.request

6.3.42.2.1 Function

This primitive is generated by the SME to request that the MLME returns the value of its TSF timer. The value returned in TSFtime (as specified in 6.3.42.2.2) is the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive is received.

6.3.42.2.2 Semantics of the service primitive

This primitive has no parameters.

6.3.42.2.3 When generated

This primitive is generated by the SME to request the value of the TSF timer from the MLME.

6.3.42.2.4 Effect of receipt

The MLME issues an MLME-GETTSFTIME.confirm.
6.3.42.2 MLME-GETTSFTIME.confirm

6.3.42.2.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the value of the TSF timer.

6.3.42.2.2 Semantics of the service primitive

This primitive uses the following parameters:

```java
MLME-GETTSFTIME.confirm(
    ResultCode,
    TSFtime
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, FAILURE</td>
<td>Reports the outcome of an MLME-GETTSFTIME.request primitive</td>
</tr>
<tr>
<td>TSFtime</td>
<td>Integer</td>
<td>0 – (2^{64} – 1)</td>
<td>The value of the TSF timer. Present only if ResultCode is SUCCESS.</td>
</tr>
</tbody>
</table>

6.3.42.2.3 When generated

This primitive is generated by the MLME to report to the SME the result of an MLME-GETTSFTIME.request.

6.3.42.2.4 Effect of receipt

The SME is notified of the result of an MLME-GETTSFTIME.request primitive and, if successful, has the value of the TSF timer at the instant the MLME-GETTSFTIME.request was received by the MLME. If the result of an MLME-GETTSFTIME.request is failure, the TSFtime parameter is not included in the MLME-GETTSFTIME.confirm primitive.

NOTE—The TSF timer value can be used, along with other information, by the SME to compute an offset between an external time standard such as a version of Universal Coordinated Time (UTC) from a Global Positioning System (GPS) unit and the TSF timer.

6.3.43 Timing Advertisement

6.3.43.1 General

The Timing Advertisement primitives are used to communicate timing and other information from the higher layers or the SME of one STA to the higher layers or SME of other STAs.

6.3.43.2 MLME-TIMING_ADVERTISEMENT.request

6.3.43.2.1 Function

This primitive is generated by the SME to request that the MLME generate a Timing Advertisement frame to transmit timing and, optionally, higher layer information.

6.3.43.2.2 Semantics of the service primitive

This primitive provides the following parameters:
MLME-TIMING_ADVERTISEMENT.request(
    PeerMACAddress,
    Capability Information,
    Country,
    Power Constraint,
    Time Advertisement,
    Extended Capabilities,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MACAddress</td>
<td>Any valid individual or group MAC address</td>
<td>The address of the peer MAC entity or group of entities to which the Timing Advertisement frame is sent.</td>
</tr>
<tr>
<td>Capability Information</td>
<td>As defined in 8.4.1.4</td>
<td>As defined in 8.4.1.4</td>
<td>The announced capabilities of the STA.</td>
</tr>
<tr>
<td>Country</td>
<td>As defined in 8.4.2.10</td>
<td>As defined in 8.4.2.10</td>
<td>The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 10.8 or when dot11MultiDomainCapabilityActivated is true.</td>
</tr>
<tr>
<td>Power Constraint</td>
<td>As defined in 8.4.2.16</td>
<td>As defined in 8.4.2.16</td>
<td>Optional. The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.</td>
</tr>
<tr>
<td>Time Advertisement</td>
<td>As defined in 8.4.2.63</td>
<td>As defined in 8.4.2.63</td>
<td>Timing announced by the STA.</td>
</tr>
<tr>
<td>Extended Capabilities</td>
<td>As defined in 8.4.2.29</td>
<td>As defined in 8.4.2.29</td>
<td>Optional. The Extended Capabilities element may be present if any of the fields in this element are nonzero.</td>
</tr>
<tr>
<td>Vendor SpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.43.2.3 When generated

This primitive is generated by the SME to request that the MLME generates a Timing Advertisement frame for transmission.

6.3.43.2.4 Effect of receipt

Upon the receipt of this primitive, the MLME attempts to transmit a Timing Advertisement frame to the specified MAC address, using the procedures defined in 10.21.

6.3.43.3 MLME-TIMING_ADVERTISEMENT.indication

6.3.43.3.1 Function

This primitive is generated by the MLME to indicate to the SME the reception of a Timing Advertisement frame.

6.3.43.3.2 Semantics of the service primitive

This primitive provides the following parameters:
MLME-TIMING_ADVERTISEMENT.indication(
  Timestamp,
  Capability Information,
  Local Time,
  Country,
  Power Constraint,
  Time Advertisement,
  Extended Capabilities,
  RCPI,
  Source MAC address,
  VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timestamp</td>
<td>Integer</td>
<td>N/A</td>
<td>The timestamp of the received frame.</td>
</tr>
<tr>
<td>Capability Information</td>
<td>As defined in 8.4.1.4</td>
<td>As defined in 8.4.1.4</td>
<td>The announced capabilities of the STA.</td>
</tr>
<tr>
<td>Local Time</td>
<td>Integer</td>
<td>N/A</td>
<td>Local Time is the value of a station’s TSF timer at the start of reception of the first octet of the timestamp field of the received Timing Advertisement frame.</td>
</tr>
<tr>
<td>Country</td>
<td>As defined in 8.4.2.10</td>
<td>As defined in 8.4.2.10</td>
<td>The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 10.8 or when dot11MultiDomainCapabilityActivated is true.</td>
</tr>
<tr>
<td>Power Constraint</td>
<td>As defined in 8.4.2.16</td>
<td>As defined in 8.4.2.16</td>
<td>The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.</td>
</tr>
<tr>
<td>Time Advertisement</td>
<td>As defined in 8.4.2.63</td>
<td>As defined in 8.4.2.63</td>
<td>Timing announced by the STA.</td>
</tr>
<tr>
<td>Extended Capabilities</td>
<td>As defined in 8.4.2.29</td>
<td>As defined in 8.4.2.29</td>
<td>The Extended Capabilities element may be present if any of the fields in this element are nonzero.</td>
</tr>
<tr>
<td>RCPI</td>
<td>Integer as defined in 8.4.2.40</td>
<td>As defined in 8.4.2.40</td>
<td>RCPI is the measured value of received channel power on the received Timing Advertisement frame.</td>
</tr>
<tr>
<td>Source MAC Address</td>
<td>As defined in 8.2.4.3.6</td>
<td>As defined in 8.2.4.3.6</td>
<td>The SA field of the MAC header from the received Timing Advertisement frame.</td>

</tbody>
</table>

### 6.3.43.3.3 When generated

This primitive is generated by the MLME when a Timing Advertisement frame is received.

### 6.3.43.3.4 Effect of receipt

Upon the receipt of this primitive, the SME is notified that a Timing Advertisement frame has been received.
6.3.44 TDLS Discovery

6.3.44.1 General

The following MLME primitives support the signaling of TDLS Discovery.

6.3.44.2 MLME-TDLSDISCOVERY.request

6.3.44.2.1 Function

This primitive requests that a TDLS Discovery Request frame be sent through the AP path.

6.3.44.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSDISCOVERY.request(
    DestinationAddress,
    TDLSDiscoveryRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DestinationAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the DA to which a TDLS Discovery Request frame is transmitted.</td>
</tr>
<tr>
<td>TDLSDiscoveryRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Discovery Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Discovery Request frame.</td>
</tr>
</tbody>
</table>

6.3.44.2.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Request frame be sent through the AP.

6.3.44.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Request frame. The STA then attempts to transmit this frame.

6.3.44.3 MLME-TDLSDISCOVERY.confirm

6.3.44.3.1 Function

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSDISCOVERY.confirm(
    TDLSPeerSTAAAddress,
    TDLSDiscoveryResponse
)
```
6.3.44.3.3 When generated

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the MLME-TDLSDISCOVERY.confirm primitive and may use the reported data.

6.3.44.4 MLME-TDLSDISCOVERY.indication

6.3.44.4.1 Function

This primitive indicates that a TDLS Discovery Request frame was received from a TDLS peer STA.

6.3.44.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.indication(
    TDLSPeerSTAAddress,
    TDLSDiscoveryRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Response frame was received.</td>
</tr>
<tr>
<td>TDLSDiscoveryResponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Discovery Response frame</td>
<td>Specifies the service parameters contained in the received TDLS Discovery Response frame.</td>
</tr>
</tbody>
</table>

6.3.44.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Discovery Request frame is received.

6.3.44.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.
6.3.44.5 MLME-TDLSDISCOVERY.response

6.3.44.5.1 Function

This primitive requests that a TDLS Discovery Response frame be sent directly to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TDLSDISCOVERY.response}(
\quad \text{TDLSPeerSTAAddress,}
\quad \text{TDLSDiscoveryResponse}
\)
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA to which a TDLS Discovery Response frame is transmitted.</td>
</tr>
<tr>
<td>TDLSDiscoveryResponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Discovery Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Discovery Response frame.</td>
</tr>
</tbody>
</table>

6.3.44.5.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Response frame be sent to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.
6.3.45 TDLS direct-link establishment

6.3.45.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-7 depicts the TDLS direct-link establishment process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

---

**Figure 6-7—TDLS direct-link establishment**
6.3.45.2 MLME-TDLSSETUPREQUEST.request

6.3.45.2.1 Function

This primitive requests that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSSETUPREQUEST.request(
    TDLSResponderAddress,
    TDLSSetupRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSResponderAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the STA to which the TDLS Setup Request frame is transmitted.</td>
</tr>
<tr>
<td>TDLSSetupRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Setup Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Setup.</td>
</tr>
</tbody>
</table>

6.3.45.2.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Request frame. The STA then attempts to transmit this frame to the candidate TDLS responder STA.

6.3.45.3 MLME-TDLSSETUPREQUEST.indication

6.3.45.3.1 Function

This primitive indicates that a TDLS Setup Request frame was received.

6.3.45.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSSETUPREQUEST.indication(
    TDLSInitiatorAddress,
    TDLSSetupRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSInitiatorAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Request frame was received.</td>
</tr>
<tr>
<td>TDLSSetupRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Setup Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Setup.</td>
</tr>
</tbody>
</table>
6.3.45.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Request frame is received.

6.3.45.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.4 MLME-TDLSSETUPRESPONSE.request

6.3.45.4.1 Function

This primitive requests that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TDLSSETUPRESPONSE.request(}
\text{TDLSInitiatorAddress,}
\text{TDLSSetupResponse}
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSInitiatorAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS initiator STA to which a TDLS Setup Response frame is transmitted.</td>
</tr>
<tr>
<td>TDLSSetupResponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Setup Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Setup.</td>
</tr>
</tbody>
</table>

6.3.45.4.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Response frame. The STA then attempts to transmit this to the TDLS initiator STA.

6.3.45.5 MLME-TDLSSETUPRESPONSE.indication

6.3.45.5.1 Function

This primitive indicates that a TDLS Setup Response frame was received from the TDLS responder STA.

6.3.45.5.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TDLSSETUPRESPONSE.indication(}
\text{TDLSSResponderAddress,}
\text{TDLSSetupResponse}
\text{)}
\]
6.3.45.5.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Response frame is received.

6.3.45.5.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.6 MLME-TDLSSETUPCONFIRM.request

6.3.45.6.1 Function

This primitive requests that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TDLSSETUPCONFIRM.request(}
  \text{TDLSSetterAddress,}
  \text{TDLSSetupConfirm}
\]

6.3.45.6.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Confirm frame. The STA then attempts to transmit this to the TDLS responder STA.

6.3.45.7 MLME-TDLSSETUPCONFIRM.indication

6.3.45.7.1 Function

This primitive indicates that a TDLS Setup Confirm frame was received from the TDLS initiator STA.
6.3.45.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSSETUPCONFIRM.indication(
    TDLSInitiatorAddress,
    TDLSSetupConfirm
)

6.3.45.7.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Confirm frame is received.

6.3.45.7.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.8 MLME-TDLSPOTENTIALPEERSTA.request

6.3.45.8.1 Function

This primitive requests information about a potential TDLS peer STA.

6.3.45.8.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-TDLSPOTENTIALPEERSTA.request(
    MACAddress
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the potential TDLS peer STA.</td>
</tr>
</tbody>
</table>

6.3.45.8.3 When generated

This primitive is generated by the SME to request the MLME to provide information about a potential TDLS peer STA.

6.3.45.8.4 Effect of receipt

On receipt of this primitive, the MLME responds with the requested information about the identified STA.
6.3.45.9 MLME-TDLSPOTENTIALPEERSTA.confirm

6.3.45.9.1 Function

This primitive informs the SME about a potential TDLS peer STA.

6.3.45.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPOTENTIALPEERSTA.confirm(
    MACAddress, RSSI, VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the STA for which information is requested.</td>
</tr>
<tr>
<td>RSSI</td>
<td>Integer</td>
<td>–1-RSSI Max</td>
<td>Specifies the RSSI from the STA. –1 indicates that the STA is not present.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>Vendor Specific</td>
<td>Vendor Specific</td>
<td>Specifies vendor-specific information about the STA identified in the MACAddress field.</td>
</tr>
</tbody>
</table>

6.3.45.9.3 When generated

This primitive is generated by the MLME to indicate to the SME that a potential TDLS peer STA has been detected.

6.3.45.9.4 Effect of receipt

On receipt of this primitive, the SME may attempt to set up a TDLS direct link by issuing an MLME-TDLSSETUPREQUEST.request primitive to the MLME.
6.3.46 TDLS direct-link teardown

6.3.46.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-8 depicts the TDLS direct-link teardown process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

![Figure 6-8—TDLS direct-link teardown](image)

### 6.3.46.2 MLME-TDLSTEARDOWN.request

#### 6.3.46.2.1 Function

This primitive requests that a TDLS Teardown frame be sent to the TDLS peer STA.

#### 6.3.46.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSTEARDOWN.request(
    TDLSPeerSTAAddress,  
    TDLSTeardown
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA to which a TDLS Teardown frame is transmitted.</td>
</tr>
<tr>
<td>TDLSTeardown</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Teardown frame</td>
<td>Specifies the proposed service parameters for the TDLS teardown.</td>
</tr>
</tbody>
</table>

#### 6.3.46.2.3 When generated

This primitive is generated by the SME to request that a TDLS Teardown frame be sent to the TDLS peer STA.
6.3.46.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Teardown frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.46.3 MLME-TDLSTEARDOWN.indication

6.3.46.3.1 Function

This primitive indicates that a TDLS Teardown frame was received from a TDLS peer STA.

6.3.46.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSTEARDOWN.indication(
    TDLSPeerSTAAddress,
    TDLS Teardown
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the TDLS peer STA from which a TDLS Teardown frame was received.</td>
</tr>
<tr>
<td>TDLS Teardown</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Teardown frame</td>
<td>Specifies the proposed service parameters for the TDLS teardown.</td>
</tr>
</tbody>
</table>

6.3.46.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Teardown frame is received.

6.3.46.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.22.
6.3.47 TDLS Peer U-APSD

6.3.47.1 General

The following MLME primitives support the signaling of TDLS Peer U-APSD. Figure 6-9 depicts the TDLS peer U-APSD process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

![Diagram of TDLS Peer U-APSD process](image)

**Figure 6-9—TDLS Peer U-APSD**

6.3.47.2 MLME-TDLSPTI.request

6.3.47.2.1 Function

This primitive requests that a TDLS Peer Traffic Indication frame be sent to a TDLS peer STA.

6.3.47.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-TDLSPTI.request(
    TDLSPeerSTAAddress,
    TDLSPTI
)
```
6.3.47.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Indication frame be sent to the TDLS peer STA.

6.3.47.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Indication frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.47.3 MLME-TDLSPTI.confirm

6.3.47.3.1 Function

This primitive reports the result of an MLME-TDLSPTI.request primitive to trigger an unscheduled SP from a candidate TDLS peer STA. This primitive is generated after transmitting a Peer Traffic Indication frame when this frame contains a PTI Control field, and after receiving a Peer Traffic Response frame otherwise.

6.3.47.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TDLSPTI.confirm}() \\
\quad \text{TDLSPeerSTAAddress,} \\
\quad \text{TDLSPTR} \\
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the MAC entity with which to perform the TDLS peer U-APSD process.</td>
</tr>
<tr>
<td>TDLSPTI</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer Traffic Indication frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer U-APSD.</td>
</tr>
</tbody>
</table>

6.3.47.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPTI.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer Traffic Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.47.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPTI.request primitive and may use the reported data.
6.3.47.4 MLME-TDLSPTI.indication

6.3.47.4.1 Function

This primitive indicates that a TDLS Peer Traffic Indication frame was received from a TDLS peer STA.

6.3.47.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-TDLSPTI.indication(
    TDLSPeerSTAAddress,
    TDLSPTI
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA MAC entity from which a TDLS Peer Traffic Indication frame was received.</td>
</tr>
<tr>
<td>TDLSPTI</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer Traffic Indication frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer U-APSD.</td>
</tr>
</tbody>
</table>

6.3.47.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer Traffic Indication frame is received.

6.3.47.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure as specified in 10.2.1.15.

6.3.47.5 MLME-TDLSPTI.response

6.3.47.5.1 Function

This primitive requests that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.47.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-TDLSPTI.response(
    PeerSTAAddress,
    TDLSPTR
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity with which to perform the TDLS Peer U-APSD.</td>
</tr>
<tr>
<td>TDLSPTR</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer Traffic Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer U-APSD.</td>
</tr>
</tbody>
</table>
6.3.47.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.47.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48 TDLS channel switching

6.3.48.1 General

The following MLME primitives support the signaling of a TDLS channel switch. Figure 6-10 depicts the TDLS channel switching process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

![Figure 6-10—TDLS channel switching](image-url)
6.3.48.2 MLME-TDLSCHANNELSWITCH.request

6.3.48.2.1 Function

This primitive requests that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSCHANNELSWITCH.request(
    TDLSPeerSTAAddress,  
    TDLSChannelSwitchRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the TDLS peer MAC entity to which a TDLS Channel Switch Request frame is transmitted.</td>
</tr>
<tr>
<td>TDLSChannelSwitchRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Channel Switch Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Channel Switch.</td>
</tr>
</tbody>
</table>

6.3.48.2.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48.3 MLME-TDLSCHANNELSWITCH.confirm

6.3.48.3.1 Function

This primitive reports the result of an MLME-TDLSCHANNELSWITCH.request primitive to switch a channel with a TDLS peer STA.

6.3.48.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-TDLSCHANNELSWITCH.confirm(
    TDLSPeerSTAAddress,  
    TDLSChannelSwitchResponse
)
```
6.3.48.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSCHANNELSWITCH.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Channel Switch Response frame from the TDLS peer STA.

6.3.48.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSCHANNELSWITCH.request primitive and may use the reported data.

6.3.48.4 MLME-TDLSCHANNELSWITCH.indication

6.3.48.4.1 Function

This primitive indicates that a TDLS Channel Switch request frame was received from a TDLS peer STA.

6.3.48.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TDLSCHANNELSWITCH.indication(
  TDLSPeerSTAAddress,  
  TDLSChannelSwitchRequest
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Response frame was received.</td>
</tr>
<tr>
<td>TDLSChannelSwitchRes ponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Channel Switch Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Channel Switch.</td>
</tr>
</tbody>
</table>

6.3.48.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Channel Switch Request frame is received.

6.3.48.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.22.
6.3.48.5 MLME-TDLSCHANNELSWITCH.response

6.3.48.5.1 Function

This primitive requests that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.response(
    TDLSPeerSTAAddress,
    TDLSChannelSwitchResponse
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA to which a TDLS Channel Switch Response frame is transmitted.</td>
</tr>
<tr>
<td>TDLSChannelSwitchResponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Channel Switch Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Channel Switch.</td>
</tr>
</tbody>
</table>

6.3.48.5.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.
6.3.49 TDLS Peer PSM

6.3.49.1 General

The following MLME primitives support the management of TDLS Peer PSM. Figure 6-11 depicts the TDLS Peer PSM process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

![Diagram of TDLS Peer PSM process](image)

**Figure 6-11—TDLS Peer PSM**

6.3.49.2 MLME-TDLSPEERPSM.request

6.3.49.2.1 Function

This primitive requests that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-TDLSPEERPSM.request(
    TDLSPeerSTAAddress,
    TDLSPeerPSMRequest
)
```
6.3.49.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.49.3 MLME-TDLSPEERPSM.confirm

6.3.49.3.1 Function

This primitive reports the result of an MLME-TDLSPEERPSM.request primitive to initiate power save mode based on scheduled service periods with a TDLS peer STA.

6.3.49.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.confirm(
    TDLSPeerSTAAddress,
    TDLSPeerPSMResponse
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Request frame is transmitted.</td>
</tr>
<tr>
<td>TDLSPeerPSMRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer PSM Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer PSM.</td>
</tr>
</tbody>
</table>

6.3.49.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPEERPSM.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer PSM Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.49.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPEERPSM.request primitive and may use the reported data.
6.3.49.4 MLME-TDLSPEERPSM.indication

6.3.49.4.1 Function

This primitive indicates that a TDLS Peer PSM Request frame was received from a TDLS peer STA.

6.3.49.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.indication(
    TDLSPeerSTAAddress,
    TDLSPeerPSMRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

</tr>
<tr>
<td>TDLSPeerPSMRequest</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer PSM Request frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer PSM.</td>
</tr>
</tbody>
</table>

6.3.49.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer PSM Request frame is received.

6.3.49.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.14.

6.3.49.5 MLME-TDLSPEERPSM.response

6.3.49.5.1 Function

This primitive requests that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.response(
    TDLSPeerSTAAddress,
    TDLSPeerPSMResponse
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDLSPeerSTAAddress</td>

</tr>
<tr>
<td>TDLSPeerPSMResponse</td>
<td>Sequence of octets</td>
<td>As defined in TDLS Peer PSM Response frame</td>
<td>Specifies the proposed service parameters for the TDLS Peer PSM.</td>
</tr>
</tbody>
</table>
6.3.49.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.50 Event request

6.3.50.1 General

This set of primitives supports the exchange of Event Request and Event Report frames. The informative diagram shown in Figure 6-12 illustrates the Event Request and Event Report process, and is not meant to be exhaustive of all possible protocol uses.

Figure 6-12—Event protocol exchange
6.3.50.2 MLME-EVLREQUEST.request

6.3.50.2.1 Function

This primitive requests the transmission of an event request to a peer entity.

6.3.50.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Event Request Set,
    Destination URI
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the event request is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the event transaction.</td>
</tr>
<tr>
<td>Event Request Set</td>
<td>Set of event elements</td>
<td>Set of event elements</td>
<td>A set of event elements describing the requested event.</td>
</tr>
<tr>
<td>Destination URI</td>
<td>Destination URI element</td>
<td>Destination URI element</td>
<td>The Destination URI element as defined in 8.4.2.92.</td>
</tr>
</tbody>
</table>

6.3.50.2.3 When generated

This primitive is generated by the SME to request that an Event Request frame be sent to a peer entity to initiate one or more transactions.

6.3.50.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Request frame containing the set of event elements specified. This frame is then scheduled for transmission.

6.3.50.3 MLME-EVLREQUEST.indication

6.3.50.3.1 Function

This primitive indicates that an Event Request frame requesting an event transaction has been received.

6.3.50.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREQUEST.indication(
    Peer MAC Address,
    Dialog Token,
    Event Request Set,
    Destination URI
)
```
6.3.50.3.3 When generated

This primitive is generated by the MLME when a valid Event Request frame is received.

6.3.50.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the event transaction.

6.3.51 Event report

6.3.51.1 General

This set of primitives supports the signaling of event reports.

6.3.51.2 MLME-EVLREPORT.request

6.3.51.2.1 Function

This primitive supports the signaling of event reports between peer SMEs.

6.3.51.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREPORT.request(
    Peer MAC Address,
    Dialog Token,
    Event Report Set
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the event request was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the event transaction.</td>
</tr>
<tr>
<td>Event Report Set</td>
<td>Set of event elements</td>
<td>Set of event elements</td>
<td>A set of event elements describing the requested event.</td>
</tr>
<tr>
<td>Destination URI</td>
<td>Destination URI element</td>
<td>Destination URI element</td>
<td>The Destination URI element as defined in 8.4.2.92.</td>
</tr>
</tbody>
</table>

6.3.51.2.3 When generated

This primitive is generated by the SME to request that an Event Report frame be sent to a peer entity to report the results of one or more transactions.
6.3.51.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Report frame containing the set of event elements. This frame is then scheduled for transmission.

6.3.51.3 MLME-EVLREPORT.indication

6.3.51.3.1 Function

This primitive indicates that an Event Report frame has been received from a peer entity.

6.3.51.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREPORT.indication(
    Peer MAC Address,
    Dialog Token,
    Event Report Set
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the event report was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the event transaction.</td>
</tr>
<tr>
<td>Event Report Set</td>
<td>Set of event elements</td>
<td>Set of event elements</td>
<td>A set of event elements describing the response to the event request.</td>
</tr>
</tbody>
</table>

6.3.51.3.3 When generated

This primitive is generated by the MLME when a valid Event Report frame is received.

6.3.51.3.4 Effect of receipt

On receipt of this primitive, the event data can be made available for SME processes.

6.3.52 Event

6.3.52.1 General

This set of primitives supports the requesting and reporting of event data.

6.3.52.2 MLME-EVLOG.request

6.3.52.2.1 Function

This primitive is generated by the SME to request that the MLME identify specific events.

6.3.52.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.request(}
Dialog Token,
Event Request Set
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the event transaction.</td>
</tr>
<tr>
<td>Event Request Set</td>
<td>Set of event elements</td>
<td>Set of event elements</td>
<td>A set of event elements describing the response to the event request.</td>
</tr>
</tbody>
</table>

6.3.52.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified event.

6.3.52.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the identification of events.

6.3.52.3 MLME-EVLOG.confirm

6.3.52.3.1 Function

This primitive reports the result of an event.

6.3.52.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLOG.confirm(
  Dialog Token,
  Event Report Set
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the event transaction.</td>
</tr>
<tr>
<td>Event Report Set</td>
<td>Set of event report elements</td>
<td>Set of event report elements</td>
<td>A set of event report elements describing the reported event.</td>
</tr>
</tbody>
</table>

6.3.52.3.3 When generated

This primitive is generated by the MLME to report the results when event identification completes.

6.3.52.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and, if appropriate, stores the events pending communication to the requesting entity or for local use.
6.3.53 Diagnostic request

6.3.53.1 General

This set of primitives supports the initiation of diagnostics between peer SMEs. The informative diagram shown in Figure 6-13 depicts the diagnostic reporting process and is not meant to be exhaustive of all possible protocol uses.

![Diagram of Diagnostic protocol exchange](image)

Figure 6-13—Diagnostic protocol exchange

6.3.53.2 MLME-DIAGREQUEST.request

6.3.53.2.1 Function

This primitive requests the transmission of a Diagnostic Request frame to a peer entity.

6.3.53.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-DIAGREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Diagnostic Request Set,
    Destination URI
)
```
6.3.53.2.3 When generated

This primitive is generated by the SME to request that a Diagnostic Request frame be sent to a peer entity to initiate one or more diagnostic transactions.

6.3.53.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Request frame containing the set of diagnostic elements specified. This frame is then scheduled for transmission.

6.3.53.3 MLME-DIAGREQUEST.indication

6.3.53.3.1 Function

This primitive indicates that a Diagnostic Request frame requesting a Diagnostic transaction has been received.

6.3.53.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DIAGREQUEST.indication(}
\begin{align*}
\text{Peer MAC Address,} \\
\text{Dialog Token,} \\
\text{Diagnostic Request Set,} \\
\text{Destination URI}
\end{align*}
\)

<table>
<thead>
<tr>

6.3.53.3.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Request frame is received.
6.3.53.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the diagnostic transaction.

6.3.54 Diagnostic report

6.3.54.1 MLME-DIAGREPORT.request

6.3.54.1.1 Function

This primitive supports the signaling of diagnostic reports between peer SMEs.

6.3.54.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DIAGREPORT.request(}
\begin{align*}
\text{Peer MAC Address,} \\
\text{Dialog Token,} \\
\text{Diagnostic Report Set}
\end{align*}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the diagnostic report was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the diagnostic transaction.</td>
</tr>
<tr>
<td>Diagnostic Report Set</td>
<td>Set of diagnostic elements</td>
<td>Set of diagnostic elements</td>
<td>A set of diagnostic elements describing the results of the requested diagnostics.</td>
</tr>
</tbody>
</table>

6.3.54.1.3 When generated

This primitive is generated by the SME to request that a Diagnostic Report frame be sent to a peer entity to report the results of one or more diagnostic transactions.

6.3.54.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Report frame containing the set of diagnostic elements. This frame is then scheduled for transmission.

6.3.54.2 MLME-DIAGREPORT.indication

6.3.54.2.1 Function

This primitive indicates that a Diagnostic Report frame has been received from a peer entity.

6.3.54.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DIAGREPORT.indication(}
\begin{align*}
\text{Peer MAC Address,} \\
\text{Dialog Token,} \\
\text{Diagnostic Report Set}
\end{align*}
\]
6.3.54.2.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Report frame is received.

6.3.54.2.4 Effect of receipt

On receipt of this primitive, the diagnostic data can be made available for SME processes.

6.355 Location Configuration request

6.355.1 General

This set of primitives supports the exchange of location configuration parameter information between peer SMEs. The informative diagram shown in Figure 6-14 depicts the location configuration request and response process, and is not meant to be exhaustive of all possible protocol uses.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>

<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the diagnostic transaction.</td>
</tr>
<tr>
<td>Diagnostic Report Set</td>
<td>Set of diagnostic elements</td>
<td>Set of diagnostic elements</td>
<td>A set of diagnostic elements describing the results of the requested diagnostics.</td>
</tr>
</tbody>
</table>

Figure 6-14—Location configuration request and response protocol exchange
6.3.55.2 MLME-LOCATIONCFG.request

6.3.55.2.1 Function

This primitive requests the transmission of a Location Configuration Request frame to a peer entity.

6.3.55.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-LOCATIONCFG.request}( \text{Peer MAC Address, Dialog Token, Location Parameters} )
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>

<td>Location Parameters element</td>
<td>A Location Parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.</td>
</tr>
</tbody>
</table>

6.3.55.2.3 When generated

This primitive is generated by the SME to request that a Location Configuration Request frame be sent to a peer entity to convey location configuration information.

6.3.55.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Request frame containing the set of Location Parameters elements specified. This frame is then scheduled for transmission.

6.3.55.3 MLME-LOCATIONCFG.confirm

6.3.55.3.1 Function

This primitive reports the result of a location configuration request.

6.3.55.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-LOCATIONCFG.confirm}( \text{Dialog Token, Peer MAC Address, Location Parameters} )
\]
6.3.55.3.3 When generated

This primitive is generated by the MLME when transmission of the Location Configuration Request frame is acknowledged, when (re)transmission of the Location Configuration Request frame fails, or when a failure reason is unspecified.

6.3.55.3.4 Effect of receipt

No effect of receipt is specified.

6.3.55.4 MLME-LOCATIONCFG.indication

6.3.55.4.1 Function

This primitive indicates that a Location Configuration Request frame has been received requesting a location transaction.

6.3.55.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONCFG.indication(
  Peer MAC Address,
  Dialog Token,
  Location Parameters
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the location transaction.</td>
</tr>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the location configuration response is sent.</td>
</tr>
<tr>
<td>Location Parameters</td>
<td>Location Parameters element</td>
<td>Location Parameters element</td>
<td>A Location Parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.</td>
</tr>
</tbody>
</table>

6.3.55.4.3 When generated

This primitive is generated by the MLME when a valid Location Configuration Request frame is received.

6.3.55.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the location transaction.
6.3.55.5 MLME-LOCATIONCFG.response

6.3.55.5.1 Function

This primitive requests the transmission of location information to a peer entity, in response to a received Location Configuration Request frame.

6.3.55.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-LOCATIONCFG.response(
    Peer MAC Address,
    Dialog Token,
    Location Parameters
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the location request is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the location transaction.</td>
</tr>
<tr>
<td>Location Parameters</td>
<td>Location Parameters element</td>
<td>Location Parameters element</td>
<td>A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.</td>
</tr>
</tbody>
</table>

6.3.55.5.3 When generated

This primitive is generated by the SME to request that a Location Configuration Response frame be sent to a peer entity to convey location configuration information.

6.3.55.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Response frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.
6.3.56 Location track notification

6.3.56.1 General

This set of primitives supports the location track notification from one SME to one or more receiving SMEs. The informative diagram in Figure 6-15 depicts the location track notification process, is not meant to be exhaustive of all possible protocol uses.

![Figure 6-15—Location track notification protocol exchange](image)

6.3.56.2 MLME-LOCATIONTRACKNOTIF.request

6.3.56.2.1 Function

This primitive requests the transmission of Location Configuration Request frame to a peer entity.

6.3.56.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONTRACKNOTIF.request(
    Peer MAC Address,
    Location Parameters,
    Measurement Report
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual or group addressed MAC Address</td>
<td>The address of the peer MAC entity to which the location track notification is sent.</td>
</tr>
<tr>
<td>Location Parameters</td>
<td>Location Parameters element</td>
<td>Location Parameters element</td>
<td>A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.</td>
</tr>
</tbody>
</table>

6.3.56.2.3 When generated

This primitive is generated by the SME to request that a Location Track Notification frame be sent to a peer entity to help convey location information.
6.3.56.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Track Notification frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.56.3 MLME-LOCATIONTRACKNOTIF.indication

6.3.56.3.1 Function

This primitive indicates that a Location Track Notification frame has been received.

6.3.56.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-LOCATIONTRACKNOTIF.indication(}
\quad \text{Peer MAC Address,}
\quad \text{Location Parameters,}
\quad \text{Measurement Report}
\quad \text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MAC Address</td>
<td>Any valid individual or group addressed MAC Address</td>
<td>The address of the peer MAC entity from which the location track notification was received.</td>
</tr>
<tr>
<td>Location Parameters</td>
<td>Location Parameters element</td>
<td>Location Parameters element</td>
<td>A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.</td>
</tr>
</tbody>
</table>

6.3.56.3.3 When generated

This primitive is generated by the MLME when a valid Location Track Notification frame is received.

6.3.56.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.
6.3.57 Timing measurement

6.3.57.1 General

The following set of primitives supports exchange of timing measurement information from one SME to another. The informative diagram in Figure 6-16 depicts various points in time that are of interest to the timing measurement procedure.

![Figure 6-16—Timing measurement primitives and timestamps capture](image)

NOTE 1—In Figure 6-16, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna port. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-16, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna port. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the receive antenna port by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

6.3.57.2 MLME-TIMINGMSMT.request

6.3.57.2.1 Function

This primitive requests the transmission of Timing Measurement frame to a peer entity.

6.3.57.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMT.request(
    Peer MAC Address,
    Dialog Token,
    Follow Up Dialog Token,
    t1,
    Max t1 Error,
    t4,
    Max t4 Error,
    VendorSpecific
)
```
6.3.57.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement frame be sent to a peer entity.

6.3.57.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.57.3 MLME-TIMINGMSMT.confirm

6.3.57.3.1 Function

This primitive indicates that a Timing Measurement frame has been successfully received by the peer STA to which it was sent.

6.3.57.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMT.confirm(
    Peer MAC Address,
    Dialog Token,
    t1,
    Max t1 Error,
    t4,
    Max t4 Error
)
```
6.3.57.3.3 When generated

This primitive is generated by the MLME when an ACK corresponding to the Timing Measurement frame is received from the peer STA.

6.3.57.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57.4 MLME-TIMINGMSMT.indication

6.3.57.4.1 Function

This primitive indicates that a Timing Measurement frame has been received and the corresponding ACK has been transmitted.

6.3.57.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMT.indication(  
    Peer MAC Address,  
    Dialog Token,  
    Follow Up Dialog Token,  
    t1,  
    Max t1 Error,  
    t4,  
    Max t4 Error,  
    t2,  
    Max t2 Error,  
    t3,  
    Max t3 Error,  
)
```

<table>

6.3.58 BSS Transition Management

6.3.58.1 BSS Transition Management procedure

The informative diagram shown in Figure 6-17 depicts the BSS Transition Management procedure and is not meant to be exhaustive of all possible protocol uses.

![Diagram of BSS Transition Management procedure]

Figure 6-17—BSS Transition Management request—accepted

6.3.58.2 MLME-BTMQUERY.request

This set of primitives supports the signaling of BSS Transition Management Query frames between non-AP STAs and an AP.

6.3.58.2.1 Function

This primitive requests transmission of a BSS Transition Management Query frame to the AP with which the STA is associated.
6.3.58.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-BTMQUERY.request(}
\begin{align*}
\text{Peer MAC Address,} \\
\text{DialogToken,} \\
\text{BSSTransitionQueryReason,} \\
\text{BSSTransitionCandidateListEntries}
\end{align*}
\]

</tr>
</tbody>
</table>

6.3.58.2.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Query frame be sent to the AP with which the STA is associated to initiate a BSS Transition Management procedure.

6.3.58.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Query management frame of action type. The STA then attempts to transmit the frame to the AP with which it is associated.

6.3.58.3 MLME-BTMQUERY.indication

6.3.58.3.1 Function

This primitive indicates that a BSS Transition Management Query frame was received from a non-AP STA.

6.3.58.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-BTMQUERY.indication(}
\begin{align*}
\text{Peer MAC Address,} \\
\text{DialogToken,} \\
\text{BSSTransitionQueryReason,} \\
\text{BSSTransitionCandidateListEntries}
\end{align*}
\]
6.3.58.3.3 When generated

This primitive is generated by the MLME when a valid BSS Transition Management Query frame is received.

6.3.58.3.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 10.23.6.

6.3.58.4 MLME-BTM.request

6.3.58.4.1 Function

This primitive requests transmission of a BSS Transition Management Request frame to a non-AP STA.

6.3.58.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-BTM.request(
    Peer MAC Address,
    DialogToken,
    RequestMode,
    DisassociationTimer,
    ValidityInterval,
    BSSTerminationDuration,
    SessionInformationURL,
    BSSTransitionCandidateListEntries
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

</tr>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the BSS Transition Management Request frame is sent.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the BSS Transition Management transaction. Set to 0 for an autonomous BSS Transition Management Request frame.</td>
</tr>
</tbody>
</table>
6.3.58.4.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Request frame be sent to an associated non-AP STA. This request is sent either following the reception of a MLME-BTMQUERY.indication or may be sent autonomously.

6.3.58.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Request management frame of action type. The STA then attempts to transmit this frame to the indicated non-AP STA.

6.3.58.5 MLME-BTM.indication

6.3.58.5.1 Function

This primitive indicates that a BSS Transition Management Request frame was received from the AP with which the STA is associated.

6.3.58.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.indication(
    PeerMACAddress,
    DialogToken,
    RequestMode,
    DisassociationTimer,
    ValidityInterval,
    BSSTerminationDuration,

</tbody>
</table>

**6.3.58.5.3 When generated**

This primitive is generated by the MLME when a valid BSS Transition Management Request frame is received. This primitive is also generated when a timeout or failure occurs.

**6.3.58.5.4 Effect of receipt**

On receipt of this primitive the SME shall operate according to the procedure in 10.23.6.

**6.3.58.6 MLME-BTM.response**

**6.3.58.6.1 Function**

This primitive requests transmission of a BSS Transition Management Response frame to the AP with which the STA is associated.

**6.3.58.6.2 Semantics of the service primitive**

The primitive parameters are as follows:

```java
MLME-BTM.response(
    Peer MAC Address
)```
6.3.58.6.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Response frame be sent to the AP with which the STA is associated.

6.3.58.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Response management frame of action type. The non-AP STA then attempts to transmit this to the AP with which it is associated.

6.3.58.7 MLME-BTM.confirm

6.3.58.7.1 Function

This primitive reports the results of a BSS Transition Management attempt with a specified peer MAC entity that is within an AP.

6.3.58.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.confirm(
    Peer MAC Address,
    DialogToken,
    BSSTransitionQueryReason,
    StatusCode,
    BSSTerminationDelay,
    TargetBSSID,
    BSSTransitionCandidateListEntries
)
```
6.3.58.7.3 When generated

This primitive is generated by the MLME when transmission of the BSS Transition Management Request frame is acknowledged, when (re)transmission of the BSS Transition Management Request frame fails, or when a failure reason is unspecified.

6.3.58.7.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 10.23.6.
6.3.59 FMS setup

6.3.59.1 General

The following MLME primitives support the signaling of FMS Setup. The informative diagram shown in Figure 6-18 depicts the FMS setup process and is not meant to be exhaustive of all possible protocol uses.

![Diagram of FMS setup protocol exchange]

**Figure 6-18—FMS setup protocol exchange**

6.3.59.2 MLME-FMS.request

6.3.59.2.1 Function

This primitive requests that an FMS Request frame be sent to the AP with which the non-AP STA is associated.

6.3.59.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-FMS.request(
    PeerSTAAddress,
    DialogToken,
    FMSRequest
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity with which to perform the FMS process.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the FMS transaction.</td>
</tr>
</tbody>
</table>
6.3.59.2.3 When generated

This primitive is generated by the SME to request that an FMS Request frame be sent to the AP with which the STA is associated.

6.3.59.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.59.3 MLME-FMS.confirm

6.3.59.3.1 Function

This primitive reports the result of an FMS procedure.

6.3.59.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FMS.confirm( Peer MAC Address, Dialog Token, FMSResponse )

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the location response is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>0–255</td>
<td>The dialog token to identify the FMS transaction.</td>
</tr>
<tr>
<td>FMSResponse</td>
<td>FMS Response element</td>
<td>As defined in 8.4.2.79</td>
<td>Specifies service parameters for the FMS.</td>
</tr>
</tbody>
</table>

6.3.59.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-FMS.request and indicates the results of the request. This primitive is generated when a timeout or failure occurs or when the STA receives an FMS Response frame from the AP.

6.3.59.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.16.

6.3.59.4 MLME-FMS.indication

6.3.59.4.1 Function

This primitive indicates that an FMS Request frame was received from a non-AP STA.
6.3.59.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FMS.indication(
    PeerSTAAddress,
    DialogToken,
    FMSRequest
)

6.3.59.4.3 When generated

This primitive is generated by the MLME when a valid FMS Request frame is received.

6.3.59.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.16.

6.3.59.5 MLME-FMS.response

6.3.59.5.1 Function

This primitive is either generated in response to a received FMS Request frame or autonomously by the AP and requests the transmission of an FMS Response frame.

6.3.59.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FMS.response(
    PeerSTAAddress,
    FMSResponse
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which an FMS Request frame was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the FMS transaction.</td>
</tr>
<tr>
<td>FMSRequest</td>
<td>FMS Request element</td>
<td>As defined in 8.4.2.78</td>
<td>Specifies the proposed service parameters for the FMS.</td>
</tr>
</tbody>
</table>

6.3.59.5.3 When generated

This primitive is generated by the SME to request that an FMS Response frame be sent to a peer entity to convey FMS information.
6.3.59.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.60 Collocated Interference request

6.3.60.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs. The informative diagram shown in Figure 6-19 depicts the Collocated Interference request and response process, and is not meant to be exhaustive of all possible protocol uses.

Figure 6-19—Collocated interference protocol exchange
6.3.60.2 MLME-CLINTERFERENCEREQUEST.request

6.3.60.2.1 Function

This primitive requests the transmission of Collocated Interference Request frame to a peer entity.

6.3.60.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CLINTERFERENCEREQUEST.request(}
\text{Peer MAC Address, Dialog Token, Request Info)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address, or the group MAC address</td>
<td>The address of the peer MAC entity to which the collocated interference request is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the collocated interference transaction.</td>
</tr>
<tr>
<td>Request Info</td>
<td>Integer</td>
<td>As defined in the Collocated Interference Request frame, see 8.5.14.13</td>
<td>Specifies the requested information.</td>
</tr>
</tbody>
</table>

6.3.60.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Request frame be sent to a peer entity.

6.3.60.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Request frame. This frame is then scheduled for transmission.

6.3.60.3 MLME-CLINTERFERENCEREQUEST.indication

6.3.60.3.1 Function

This primitive indicates that a Collocated Interference Request frame has been received requesting a Collocated Interference report.

6.3.60.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CLINTERFERENCEREQUEST.indication(}
\text{Peer MAC Address, Dialog Token, Request Info)}
\]
6.3.60.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Request frame is received.

6.3.60.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the Collocated Interference reporting procedure as described in 10.23.8.

6.3.61 Collocated Interference report

6.3.61.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs.

6.3.61.2 MLME-CLINTERFERENCEREPORT.request

6.3.61.2.1 Function

This primitive requests the transmission of Collocated Interference Report to a peer entity, in response to a received Collocated Interference Request frame.

6.3.61.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CLINTERFERENCEREPORT.request(}
\begin{align*}
\text{Peer MAC Address}, \\
\text{Dialog Token}, \\
\text{Collocated Interference Report}
\end{align*}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address or the group MAC address</td>
<td>The address of the peer MAC entity from which the Collocated Interference request was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the collocated interference transaction.</td>
</tr>
<tr>
<td>Request Info</td>
<td>Integer</td>
<td>As defined in the Collocated Interference Request frame, see 8.5.14.13</td>
<td>Specifies the requested information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the Collocated Interference Report is sent.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the collocated interference transaction.</td>
</tr>
<tr>
<td>Collocated</td>
<td>Collocated</td>
<td>As defined in 8.4.2.87</td>
<td>Specifies the collocated interference characteristics.</td>
</tr>
<tr>
<td>Interference Report</td>
<td>Interference Report elements</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
6.3.61.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Report frame be sent to a peer entity to convey collocated interference information.

6.3.61.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Report frame. This frame is then scheduled for transmission.

6.3.61.3 MLME-CLINTERFERENCEREPORT.indication

6.3.61.3.1 Function

This primitive indicates that a Collocated Interference Report frame has been received.

6.3.61.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CLINTERFERENCEREPORT.indication(  
Peer MAC Address,  
Dialog Token,  
Collocated Interference Report  
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peer MAC Address</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the location response was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the location transaction.</td>
</tr>
<tr>
<td>Collocated Interference Report</td>
<td>Collocated Interference Report elements</td>
<td>As defined in 8.4.2.87</td>
<td>Specifies the collocated interference characteristics.</td>
</tr>
</tbody>
</table>

6.3.61.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Report frame is received.
6.3.62 TFS Setup

6.3.62.1 General

This set of primitives supports the exchange of the signaling of TFS Setup between peer SMEs. The informative diagram shown in Figure 6-20 depicts the TFS request and response process, and is not meant to be exhaustive of all possible protocol uses.

![Figure 6-20—TFS request and response exchange](image)

6.3.62.2 MLME-TFS.request

6.3.62.2.1 Function

This primitive requests that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.62.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.request(
    PeerSTAAddress,
    DialogToken,
    TFSRequest,
    VendorSpecific
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>Specifies the address of the peer MAC entity for TFS.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The Dialog Token to identify the TFS Request and Response transaction.</td>
</tr>
</tbody>
</table>
6.3.62.2.3 When generated

This primitive is generated by the SME to request that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.62.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.62.3 MLME-TFS.confirm

6.3.62.3.1 Function

This primitive reports the result of a TFS procedure.

6.3.62.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TFS.confirm(
    PeerSTAAddress, 
    DialogToken, 
    TFSResponse, 
    VendorSpecific
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TFSRequest</td>
<td>A set of TFS Request elements</td>
<td>As defined in the TFS Request element</td>
<td>Specifies the proposed service parameters for the TFS. One or more TFS Request elements.</td>
</tr>
<tr>
<td>VendorSpecific</td>
<td>A set of information elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.62.3.3 When generated

This primitive is generated by the MLME when transmission of the TFS Request frame is acknowledged, when (re)transmission of the TFS Request frame fails, when a failure reason is unspecified, or when the STA receives a TFS Response frame from the AP.
This primitive is also generated when the MLME-TFS.request contains invalid parameters and when a timeout or failure occurs.

6.3.62.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and may use the reported data. The SME should operate according to the procedure in 10.23.11.

6.3.62.4 MLME-TFS.indication

6.3.62.4.1 Function

This primitive indicates that a TFS Request frame was received from a non-AP STA.

6.3.62.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TFS.indication}(\text{PeerSTAAddress, DialogToken, TFSRequest, VendorSpecific})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which a TFS Request frame was received.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The Dialog Token to identify the TFS Request and Response transaction.</td>
</tr>
<tr>
<td>TFSRequest</td>
<td>A set of TFS Request elements</td>
<td>As defined in the TFS Request element</td>
<td>Specifies the proposed service parameters for the TFS. One or more TFS Request elements.</td>
</tr>
<tr>
<td>VendorSpecific</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.62.4.3 When generated

This primitive is generated by the MLME when a valid TFS Request action management frame is received.

6.3.62.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.11.

6.3.62.5 MLME-TFS.response

6.3.62.5.1 Function

This primitive is generated in response to an MLME-TFS.indication requesting a TFS Response frame be sent to a non-AP STA.
6.3.62.5.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TFS.response(}
\quad \text{PeerSTAAddress,}
\quad \text{DialogToken,}
\quad \text{TFSResponse,}
\quad \text{VendorSpecific}
\quad )
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which a TFS Request frame was received.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The Dialog Token to identify the TFS Request and Response transaction.</td>
</tr>
<tr>
<td>TFSResponse</td>
<td>A set of TFS Response elements</td>
<td>As defined in 8.4.2.83</td>
<td>Specifies service parameters for the TFS. One or more TFS Response elements.</td>
</tr>
<tr>
<td>VendorSpecific</td>
<td>A set of elements.</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.62.5.3 When generated

This primitive is generated by the SME in response to an MLME-TFS.indication requesting a TFS Response be sent to a non-AP STA.

6.3.62.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Response action management frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.
6.3.63 Sleep Mode request

6.3.63.1 General

This set of primitives supports the exchange of sleep mode parameter information between peer SMEs. The informative diagram shown in Figure 6-21 depicts the sleep mode request and response process, and is not meant to be exhaustive of all possible protocol uses.

![Diagram of Sleep Mode Request and Response Exchange](image)

**Figure 6-21—Sleep mode request and response exchange**

6.3.63.2 MLME-SLEEPMODE.request

6.3.63.2.1 Function

This primitive requests that a Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.63.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-SLEEPMODE.request(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSRequest,
    VendorSpecificInfo
)
```
6.3.63.2.3 When generated

This primitive is generated by the SME to request that a Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.63.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sleep Mode Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.63.3 MLME-SLEEPMODE.indication

6.3.63.3.1 Function

This primitive indicates that a Sleep Mode Request frame was received from a non-AP STA.

6.3.63.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SLEEPMODE.indication(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSRequest,
    VendorSpecificInfo
)

<table>
<thead>

6.3.63.3.3 When generated

This primitive is generated by the MLME when a valid Sleep Mode Request frame is received.

6.3.63.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.18.

6.3.63.4 MLME-SLEEPMODE.response

6.3.63.4.1 Function

This primitive requests the transmission of Sleep Mode information to a peer entity, in response to a received Sleep Mode Request frame.

6.3.63.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-SLEEPMODE.response(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSResponse,
    VendorSpecificInfo
)
```

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.63.4.3 When generated

This primitive is generated by the SME to request that a Sleep Mode Response frame be sent to a peer entity to convey Sleep Mode information.
6.3.63.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sleep Mode Response frame containing the Sleep Mode elements specified. This frame is then scheduled for transmission.

6.3.63.5 MLME-SLEEPMODE.confirm

6.3.63.5.1 Function

This primitive reports the result of a request to send a Sleep Mode Response frame.

6.3.63.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.confirm(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSResponse,
    VendorSpecificInfo
)
```

<table>

<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.63.5.3 When generated

This primitive is generated by the MLME when transmission of the Sleep Mode Request frame is acknowledged, when (re)transmission of the Sleep Mode Request frame fails, when the Sleep Mode Request frame contains invalid parameters, or when a failure reason is unspecified.

6.3.63.5.4 Effect of receipt

No effect of receipt is specified.
6.3.64 TIM broadcast setup

6.3.64.1 General

The following MLME primitives support the signaling of TIM Broadcast Setup. The informative diagram shown in Figure 6-22 depicts the TIM Broadcast setup process and is not meant to be exhaustive of all possible protocol uses.

![Figure 6-22—TIM broadcast setup protocol exchange](image-url)

6.3.64.2 MLME-TIMBROADCAST.request

6.3.64.2.1 Function

This primitive requests that a TIM Broadcast Request frame be sent to the AP with which the non-AP STA is associated.
6.3.64.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.request(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastRequest
)
```

6.3.64.2.3 When generated

This primitive is generated by the SME to request that a TIM Broadcast Request frame be sent to the AP with which the STA is associated.

6.3.64.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.64.3 MLME-TIMBROADCAST.confirm

6.3.64.3.1 Function

This primitive reports the result of a TIM Broadcast procedure.

6.3.64.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.confirm(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastResponse
)
```

<table>

</table>
6.3.64.3.3 When generated

This primitive is generated by the MLME when transmission of the TIM Broadcast Request frame is acknowledged, when (re)transmission of the TIM Broadcast Request frame fails, when the TIM Broadcast Request frame contains invalid parameters, or when a failure reason is unspecified.

6.3.64.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results in the TIMBroadcastResponse element and may use the reported data.

6.3.64.4 MLME-TIMBROADCAST.indication

6.3.64.4.1 Function

This primitive indicates that a TIM Broadcast Request frame was received from a non-AP STA.

6.3.64.4.2 Semantics of the service primitive

The primitive parameters are as follows:

$$\text{MLME-TIMBROADCAST.indication}(\text{PeerSTAAddress}, \text{Dialog Token}, \text{TIMBroadcastRequest})$$

6.3.64.4.3 When generated

This primitive is generated by the MLME when a valid TIM Broadcast Request frame is received.

6.3.64.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.17.

6.3.64.5 MLME-TIMBROADCAST.response

6.3.64.5.1 Function

This primitive is generated in response to an MLME-TIMBROADCAST.indication requesting a TIM Broadcast Response frame be sent to a non-AP STA.

6.3.64.5.2 Semantics of the service primitive

The primitive parameters are as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the TIM Broadcast request and response transaction.</td>
</tr>
<tr>
<td>TIMBroadcast-Request</td>
<td>As defined in TIM Broadcast Request element</td>
<td>As defined in 8.4.2.85</td>
<td>Specifies the proposed service parameters for the TIM Broadcast.</td>
</tr>
</tbody>
</table>
MLME-TIMBROADCAST.response(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastResponse
)
6.3.65.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-QOSTRAFFICCAPUPDATE.request(
    QoSTrafficCapability
)

6.3.65.1.3 When generated

This primitive is generated by the SME to request that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.65.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QoS Traffic Capability Update action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.65.2 MLME-QOSTRAFFICCAPUPDATE.indication

6.3.65.2.1 Function

This primitive indicates that a QoS Traffic Capability Update frame was received from a non-AP STA.

6.3.65.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QOSTRAFFICCAPUPDATE.indication(
    PeerSTAAddress,
    QoS Traffic Capability
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QoS Traffic Capability</td>
<td>Bit field as defined in</td>
<td>As defined in 8.5.14.22</td>
<td>Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11MgmtOptionQoSSTrafficCapabilityActivate is true, and is not present otherwise.</td>
</tr>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which a QoS Traffic Capability Update frame was received.</td>
</tr>
<tr>
<td>QoS Traffic Capability</td>
<td>Bit field as defined in</td>
<td>As defined in 8.5.14.22</td>
<td>Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11MgmtOptionQoSSTrafficCapabilityActivate is true, and is not present otherwise.</td>
</tr>
</tbody>
</table>

6.3.65.2.3 When generated

This primitive is generated by the MLME when a valid QoS Traffic Capability Update action management frame is received.
6.3.65.2.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.9.

6.3.66 Channel Usage request

6.3.66.1 General

The following MLME primitives support the signaling of Channel Usage request. Figure 6-24 depicts the Channel Usage request process. The figure illustrates the basic protocol and is only an example and therefore is not meant to be exhaustive of all possible protocol uses.

![Diagram of Channel Usage request protocol exchange]

**Figure 6-24—Channel usage request protocol exchange**

6.3.66.2 MLME-CHANNELUSAGE.request

6.3.66.2.1 Function

This primitive requests the transmission of a Channel Usage Request frame be sent to an AP.

6.3.66.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-CHANNELUSAGE.request(
    PeerSTAAddress,
    Dialog Token,
    ChannelUsage,
    SSID,
    SupportedOperatingClasses,
    VendorSpecificInfo
)
```
6.3.66.2.3 When generated

This primitive is generated by the SME to request that a Channel Usage Request frame be sent to the BSS which is advertising the SSID passed down in this primitive.

6.3.66.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Request action management frame. The STA then attempts to transmit this to the BSS which is advertising the SSID included in this primitive request. When wild card SSID is passed down, the MLME-CHANNELREQUEST.request shall be transmitted to all BSSs in the current scan list as determined by the most recent MLME-SCAN.request.

6.3.66.3 MLME-CHANNELUSAGE.confirm

6.3.66.3.1 Function

This primitive reports the result of a Channel Usage procedure.

6.3.66.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.confirm(
    PeerSTAAddress,  
    Dialog Token,    
    ChannelUsage,    
    SSID,            
    Country String,  
    Power Constraint, 
    VendorSpecificInfo
)
```

</tbody>
</table>
6.3.66.3 When generated

This primitive is generated by the MLME as a result of an MLME-CHANNELUSAGE.request and indicates the results of the request.

This primitive is generated when the MLME-CHANNELUSAGE.request contains invalid parameters, when a timeout or failure occurs, or when the STA receives a Channel Usage Response frame from the AP.

6.3.66.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.14.

6.3.66.4 MLME-CHANNELUSAGE.indication

6.3.66.4.1 Function

This primitive indicates that a Channel Usage Request frame was received from a non-AP STA.

6.3.66.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-CHANNELUSAGE.indication}(\text{PeerSTAAddress}, \text{Dialog Token, ChannelUsage, SSID, SupportedOperatingClasses, VendorSpecificInfo})
\]

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>
6.3.66.4.3 When generated

This primitive is generated by the MLME when a valid Channel Usage Request frame is received.

6.3.66.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.14.

6.3.66.5 MLME-CHANNELUSAGE.response

6.3.66.5.1 Function

This primitive is generated in response to an MLME-CHANNELUSAGE.indication requesting a Channel Usage Response frame be sent to a non-AP STA.

6.3.66.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELUSAGE.response( PeerSTAAddress, Dialog Token, ChannelUsage, SSID, Country String, Power Constraint, VendorSpecificInfo )

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.66.5.3 When generated

This primitive is generated by the SME in response to an MLME-CHANNELUSAGE.indication requesting a Channel Usage Response be sent to a non-AP STA.

6.3.66.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67 DMS request and response procedure

6.3.67.1 General

The following MLME primitives support the signaling of DMS request and response procedure. The informative diagram shown in Figure 6-25 depicts the DMS request and response process and is not meant to be exhaustive of all possible protocol uses.

![Diagram of DMS setup protocol exchange]

Figure 6-25—DMS setup protocol exchange
6.3.67.2 MLME-DMS.request

6.3.67.2.1 Function

This primitive requests the transmission of a DMS Request frame be sent to an AP.

6.3.67.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DMS.request(}
\begin{align*}
\text{PeerSTAAddress,} \\
\text{Dialog Token,} \\
\text{DMSRequest}
\end{align*}
\)

<table>
<thead>
<tr>

<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The Dialog Token to identify the DMS request and response transaction.</td>
</tr>
<tr>
<td>DMSRequest</td>
<td>DMS Request element</td>
<td>As defined in 8.4.2.90</td>
<td>Specifies group addressed frames for the requested DMS stream.</td>
</tr>
</tbody>
</table>

6.3.67.2.3 When generated

This primitive is generated by the SME to request that a DMS Request frame be sent to the AP with which the STA is associated.

6.3.67.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Request action management frame. The STA then attempts to transmit this to the AP with which the STA is associated.

6.3.67.3 MLME-DMS.confirm

6.3.67.3.1 Function

This primitive reports the result of a DMS procedure.
6.3.67.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DMS.confirm(}
\text{PeerSTAAddress,}
\text{Dialog Token,}
\text{DMSResponse}
\text{)}
\]

<table>
<thead>
<tr>

<td>1–255</td>
<td>The Dialog Token to identify the DMS request and response transaction.</td>
</tr>
<tr>
<td>DMSResponse</td>
<td>DMS Response element</td>
<td>As defined in 8.4.2.91</td>
<td>Specifies the status returned by the AP responding to the STA's requested DMS stream.</td>
</tr>
</tbody>
</table>

6.3.67.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DMS.request and indicates the results of the request.

This primitive is generated when the MLME-DMS.request contains invalid parameters, when a timeout or failure occurs, or when the STA receives a DMS Response frame from the AP.

6.3.67.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.

6.3.67.4 MLME-DMS.indication

6.3.67.4.1 Function

This primitive indicates that a DMS Request frame was received from a non-AP STA.

6.3.67.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-DMS.indication(}
\text{PeerSTAAddress,}
\text{Dialog Token,}
\text{DMSRequest}
\text{)}
\]

<table>
<thead>
<tr>

<tr>
<td>DMSRequest</td>
<td>DMS Request element</td>
<td>As defined in 8.4.2.90</td>
<td>Specifies group addressed frames for the requested DMS stream.</td>
</tr>
</tbody>
</table>
6.3.67.4.3 When generated

This primitive is generated by the MLME when a valid DMS Request frame is received.

6.3.67.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.

6.3.67.5 MLME-DMS.response

6.3.67.5.1 Function

This primitive is generated in response to an MLME-DMS.indication requesting a DMS Response frame be sent to a non-AP STA.

6.3.67.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DMS.response(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>

<tr>
<td>DMSResponse</td>
<td>DMS Response element</td>
<td>As defined in 8.4.2.91</td>
<td>Specifies the status returned by the AP responding to the STA's requested DMS stream.</td>
</tr>
</tbody>
</table>

6.3.67.5.3 When generated

This primitive is generated by the SME in response to an MLME-DMS.indication requesting a DMS Response be sent to a non-AP STA.

6.3.67.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67.6 MLME-DMS-TERM.request

6.3.67.6.1 Function

This primitive requests the transmission of a DMS Response frame to non-AP STAs to terminate a granted DMS.

6.3.67.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DMS-TERM.request(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse
)
```
6.3.67.6.3 When generated

This primitive is generated by the SME to terminate DMS.

6.3.67.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67.7 MLME-DMS-TERM.indication

6.3.67.7.1 Function

This primitive is generated by the MLME when a valid unsolicited DMS Response frame is received.

6.3.67.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DMS-TERM.indication(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MACAddress</td>
<td>Any valid individual MAC Address</td>
<td>The address of the non-AP STA MAC entity from which a DMS Request frame was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>0</td>
<td>Set to 0 for an autonomous DMS Response frame.</td>
</tr>
<tr>
<td>DMSResponse</td>
<td>DMS Response</td>
<td>As defined in 8.4.2.91</td>
<td>Specifies the requested DMS stream that is cancelled by the AP.</td>
</tr>
</tbody>
</table>

6.3.67.7.3 When generated

This primitive is generated when the STA receives an unsolicited DMS Response frame from the AP.

6.3.67.7.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.
6.3.68 Timing Measurement Request

6.3.68.1 General

The following set of primitives supports triggering a Timing Measurement procedure or stopping an ongoing Timing Measurement procedure.

6.3.68.2 MLME-TIMINGMSMTRQ.request

6.3.68.2.1 Function

This primitive requests the transmission of a Timing Measurement Request frame to a peer entity.

6.3.68.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TIMINGMSMTRQ.request}(\text{Peer MAC Address}, \text{Trigger})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the Timing Measurement Request frame is sent.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Integer</td>
<td>0–1</td>
<td>The trigger to identify the action.</td>
</tr>
</tbody>
</table>

6.3.68.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement Request frame be sent to a peer entity.

6.3.68.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.68.3 MLME-TIMINGMSMTRQ.indication

6.3.68.3.1 Function

This primitive indicates that a Timing Measurement Request frame has been received and the corresponding ACK has been transmitted.

6.3.68.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-TIMINGMSMTRQ.indication}(\text{Peer MAC Address}, \text{Trigger})
\]
6.3.68.3.3 When generated

This primitive is generated by the MLME when a valid Timing Measurement Request frame is received.

6.3.68.3.4 1 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.69 WNM-Notification request

6.3.69.1 General

This set of primitives supports the exchange of WNM-Notification Request and Response frames between peer SMEs.

6.3.69.2 MLME-WNMNOTIFICATIONREQUEST.request

6.3.69.2.1 Function

This primitive requests the transmission of a WNM-Notification Request frame to a peer entity.

6.3.69.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Type,
    Optional Subelements
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity to which the WNM-Notification Request frame is sent.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Integer</td>
<td>0–1</td>
<td>The trigger to identify the action.</td>
</tr>
</tbody>
</table>

6.3.69.2.3 When generated

This primitive is generated by the SME to request that a WNM-Notification Request frame be sent to a peer entity to initiate a WNM-Notification.
6.3.69.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM-Notification Request frame containing the elements specified. This frame is then scheduled for transmission.

6.3.69.3 MLME-WNMNOTIFICATIONREQUEST indication

6.3.69.3.1 Function

This primitive indicates that a WNM-Notification Request frame has been received.

6.3.69.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONREQUEST.indication(
    Peer MAC Address,
    Dialog Token,
    Type,
    Optional Subelements
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the WNM-Notification request was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the WNM-Notification transaction.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
<td>1–255</td>
<td>The type of WNM-Notification Request.</td>
</tr>
<tr>
<td>Optional Subelements</td>
<td>Set subelements</td>
<td>As defined in 8.5.14.28</td>
<td>A set of subelements describing the notification.</td>
</tr>
</tbody>
</table>

6.3.69.3.3 When generated

This primitive is generated by the MLME when a valid WNM-Notification Request frame is received.

6.3.69.3.4 Effect of receipt

On receipt of this primitive, the SME replies to the request.

6.3.70 WNM-Notification response

6.3.70.1 MLME-WNMNOTIFICATIONRESPONSE.request

6.3.70.1.1 Function

This primitive supports the signaling of the WNM-Notification Response frame between peer SMEs.

6.3.70.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONRESPONSE.request(
6.3.70.1.3 When generated

This primitive is generated by the SME to request that a WNM-Notification Response frame be sent to a peer entity to report the results of the WNM-Notification.

6.3.70.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM-Notification Response frame containing the indicated fields. This frame is then scheduled for transmission.

6.3.70.2 MLME-WNMNOTIFICATIONRESPONSE.indication

6.3.70.2.1 Function

This primitive indicates that a WNM-Notification Response frame has been received from a peer entity.

6.3.70.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONRESPONSE.indication(
    Peer MAC Address,
    Dialog Token,
    Response Status,
    Optional Subelements
)
```

<table>
<thead>
<tr>

<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The address of the peer MAC entity from which the WNM-Notification Response frame was received.</td>
</tr>
<tr>
<td>Dialog Token</td>
<td>Integer</td>
<td>1–255</td>
<td>The dialog token to identify the WNM-Notification transaction.</td>
</tr>
<tr>
<td>Response Status</td>
<td>Integer</td>
<td>1–255</td>
<td>The response status of the WNM-Notification.</td>
</tr>
<tr>
<td>Optional Subelements</td>
<td>Set subelements</td>
<td>As defined in 8.5.14.29</td>
<td>A set of subelements describing the results of the WNM-Notification.</td>
</tr>
</tbody>
</table>
6.3.70.2.3 When generated

This primitive is generated by the MLME when a valid WNM-Notification Response frame is received.

6.3.70.2.4 Effect of receipt

On receipt of this primitive, the WNM-Notification can be made available for SME processes.

6.3.71 Network discovery and selection support

6.3.71.1 General

This set of primitives supports the process of GAS.

6.3.71.2 MLME-GAS.request

6.3.71.2.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

6.3.71.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-GAS.request(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    QueryFailureTimeout,
    Protected
)
```

<table>
<thead>
<tr>
<th>Name</th>

<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MacAddress</td>
<td>Any valid individual MacAddress</td>
<td>Specifies the address of the peer MAC entity to which query is transmitted.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The dialog token to identify the GAS transaction.</td>
</tr>
<tr>
<td>AdvertisementProtocolsID</td>
<td>Integer or Sequence of Integers</td>
<td>As defined in Table 8-175</td>
<td>This contains an Advertisement Protocol ID (see 8.4.2.95), which may be IEEE 802.11 assigned or vendor specified.</td>
</tr>
<tr>
<td>Query</td>
<td>String</td>
<td>N/A</td>
<td>Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.</td>
</tr>
<tr>
<td>QueryFailureTimeout</td>
<td>Integer</td>
<td>&gt; 1</td>
<td>The time limit, in units of Beacon intervals, after which the GAS Query procedure is terminated.</td>
</tr>
<tr>
<td>Protected</td>
<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using a Protected Dual of Public Action frame. Otherwise, the request is sent using a Public Action frame.</td>
</tr>
</tbody>
</table>
6.3.71.2.3 When generated

This primitive is generated by the SME at a STA to request a specific Advertisement Service from another STA.

6.3.71.2.4 Effect of receipt

The STA operates according to the procedures defined in 10.24.3.

6.3.71.3 MLME-GAS.confirm

6.3.71.3.1 Function

This primitive reports the status code and Query Response from an Advertisement Server to the requesting STA.

6.3.71.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.confirm(
    PeerSTAAddress,
    DialogToken,
    ResultCode,
    ResponseInfo,
    Protected
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MacAddress</td>
<td>Any valid individual MacAddress</td>
<td>Specifies the address of the peer MAC entity to which query is transmitted.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The dialog token to identify the GAS transaction.</td>
</tr>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, GAS_QUERY_RESPONSE_OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER</td>
<td>Indicates the result response to the GAS request from the peer MAC entity.</td>
</tr>
</tbody>
</table>
The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 8-37.

6.3.71.3.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request.

The primitive is generated when the requesting STA receives a query response in a (Protected) GAS Initial Response frame or one or more (Protected) GAS Comeback Response frames.

6.3.71.3.4 Effect of receipt

The STA operates according to the procedures defined in 10.24.3.

6.3.71.4 MLME-GAS.indication

6.3.71.4.1 Function

This primitive reports to the STA’s SME about the GAS Request.

6.3.71.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-GAS.indication(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    Protected
);
```
6.3.71.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA.

6.3.71.4.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 10.24.3.

The SME generates an MLME-GAS.response primitive within a dot11GASResponseTimeout.

6.3.71.5 MLME-GAS.response

6.3.71.5.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

6.3.71.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-GAS.response(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    Protected
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerSTAAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the query message was received.</td>
</tr>
<tr>
<td>DialogToken</td>
<td>Integer</td>
<td>0–255</td>
<td>The dialog token to identify the GAS transaction.</td>
</tr>
<tr>
<td>AdvertisementProtocolID</td>
<td>Integer or Sequence of Integers</td>
<td>As defined in Table 8-175</td>
<td>This contains an Advertisement Protocol ID (see 8.4.2.95), which may be IEEE 802.11 assigned or vendor specified.</td>
</tr>
<tr>
<td>Query</td>
<td>String</td>
<td>N/A</td>
<td>Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.</td>
</tr>
<tr>
<td>Protected</td>
<td>Boolean</td>
<td>true, false</td>
<td>Specifies whether the request was received in a Robust Management frame. If true, the request was received in a Protected Dual of Public Action frame. Otherwise, the request was received in a Public Action frame.</td>
</tr>
</tbody>
</table>
6.3.71.5.3 When generated

This primitive is generated by the MLME at a STA as a result of an MLME-GAS.indication primitive.

6.3.71.5.4 Effect of receipt

This primitive causes the MAC entity at the STA to send a (Protected) GAS Initial Response frame to the requesting STA and optionally one or more (Protected) GAS Comeback Response frames.

6.3.72 QoS Map Set element management

6.3.72.1 General

The QoS Map Set element is provided to non-AP STAs in (Re)Association Response frames. However, if the SME of an AP detects a change of the QoS Map information while one or more non-AP STAs are associated to the BSS, then the AP may transmit an unsolicited QoS Map Set element to associated STAs. The AP’s SME invokes the MLME-QoSMap.request primitive to cause individually addressed frames containing a QoS Map Set element to be transmitted to associated STAs. The AP’s SME invokes the MLME-QoSMap.request primitive to transmit individually addressed frames containing a QoS Map Set element to associated STAs. When a non-AP STA receives such unsolicited QoS Map information, its MLME generates a MLME-QoSMap.indication primitive to the STA’s SME. In turn, the SME should take appropriate action, e.g., initiate an ADDTS or DELTS if admission control changes are necessary.
6.3.72.2 MLME-QoSMap.request

6.3.72.2.1 Function

This primitive is used by an AP to transmit an unsolicited QoS Map Set to a specified non-AP STA MAC entity. The specified non-AP STA MAC address is an individual MAC address.

6.3.72.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-QoSMap.request}(\text{Non-APSTAAddress, QoSMapSet})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-APSTAAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which query message is received.</td>
</tr>
<tr>
<td>QoSMapSet</td>
<td>As defined in frame format</td>
<td>As defined in 8.4.2.97</td>
<td>Specifies the QoS Map Set the non-AP STA should use.</td>
</tr>
</tbody>
</table>

6.3.72.2.3 When generated

This primitive is generated by the MLME at the AP as a result of any change in the AP QoS Map configurations.

6.3.72.2.4 Effect of receipt

This primitive causes the MAC entity at the AP to send a QoS MAP Set element in a QoS MAP Configure frame to the non-AP STA.

6.3.72.3 MLME-QoSMap.indication

6.3.72.3.1 Function

This primitive reports the QoS mapping information sent from the AP to the non-AP STA.

6.3.72.3.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-QoSMap.indication}(\text{QoSMapSet})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QoSMapSet</td>
<td>As defined in frame format</td>
<td>As defined in 8.4.2.97</td>
<td>Specifies the QoS Map Set to be used by the non-AP STA.</td>
</tr>
</tbody>
</table>

6.3.72.3.3 When generated

This primitive is generated when the non-AP STA receives a QoS Map Set element in an unsolicited QoS Map Configure frame from the AP.
The SME of the non-AP STA should use the information to decide proper actions. For example, an ADDTS or DELTS procedure should be activated if the QoS Map information indicates a change in the admission control.

6.3.72.3.4 Effect of receipt

The non-AP STA operates according to the procedures defined in 10.24.9.

6.3.73 Mesh peering management

6.3.73.1 Introduction

The following primitives facilitate the mesh peering management protocol and authenticated mesh peering exchange protocol.

6.3.73.2 MLME-MESHPEERINGMANAGEMENT.request

6.3.73.2.1 Function

This primitive requests that the MAC entity establish, confirm, or close a mesh peering with the specified peer MAC entity by sending a Mesh Peering Management frame to the peer MAC entity. The mesh peering management procedures are specified in 13.3.

6.3.73.2.2 Semantics of the service primitive

The primitive parameters are as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the Mesh Peering Management frame is to be sent.</td>
</tr>
<tr>
<td>MeshPeeringMgmtFrameContent</td>
<td>Sequence of octets</td>
<td>As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4</td>
<td>The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity.</td>
</tr>
</tbody>
</table>

6.3.73.2.3 When generated

This primitive is generated by the SME to request that a Mesh Peering Management frame be sent to the specified mesh STA.

6.3.73.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Peering Management frame containing the information specified. The frame is scheduled for transmission.
6.3.73.3 MLME-MESHPEERINGMANAGEMENT.confirm

6.3.73.3.1 Function

This primitive reports the results of a request to send a Mesh Peering Management frame.

6.3.73.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MESHPEERINGMANAGEMENT.confirm(}
\]
\[
\quad \text{PeerMACAddress,}
\]
\[
\quad \text{MeshPeeringMgmtFrameContent}
\]
\[
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the Mesh Peering Management frame was sent.</td>
</tr>
<tr>
<td>MeshPeeringMgmtFrameContent</td>
<td>Sequence of octets</td>
<td>As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4</td>
<td>The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity.</td>
</tr>
</tbody>
</table>

6.3.73.3.3 When generated

This primitive is generated as a result of an MLME-MESHPEERINGMANAGEMENT.request with a specified MAC peer.

6.3.73.3.4 Effect of receipt

The SME is notified of the results of the mesh peering management protocol request.

6.3.73.4 MLME-MESHPEERINGMANAGEMENT.indication

6.3.73.4.1 Function

This primitive indicates to the SME that the MLME has received a Mesh Peering Management frame from a peer MAC entity.

6.3.73.4.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MESHPEERINGMANAGEMENT.indication(}
\]
\[
\quad \text{PeerMACAddress,}
\]
\[
\quad \text{MeshPeeringMgmtFrameContent}
\]
\[
\text{)}
\]
6.3.73.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Peering Management frame from a peer MAC entity.

6.3.73.4.4 Effect of receipt

The SME is notified of the reception of a Mesh Peering Management frame and is provided the contents of the frame.

6.3.73.5 MLME-MESHPEERINGMANAGEMENT.response

6.3.73.5.1 Function

This primitive is used to send a response to a Mesh Peering Management frame to the specified peer MAC entity.

6.3.73.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHPEERINGMANAGEMENT.response(
  PeerMACAddress,
  ResultCode,
  MeshPeeringMgmtFrameContent
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the Mesh Peering Management frame was received.</td>
</tr>
<tr>
<td>MeshPeeringMgmtFrameContent</td>
<td>Sequence of octets</td>
<td>As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4</td>
<td>The contents of the Action field of the Mesh Peering Open, Mesh Peering Close frame received from the peer MAC entity.</td>
</tr>
</tbody>
</table>

6.3.73.5.3 When generated

This primitive is generated by the SME as a response to an MLME-MESHPEERINGMANAGEMENT.indication primitive.
6.3.73.5.4 Effect of receipt

This primitive indicates scheduling for transmission of a Mesh Peering management frame containing the indicated response.

6.3.74 Mesh power management

6.3.74.1 Introduction

The following primitives describe how a mesh entity changes its mesh power mode for a mesh peering.

6.3.74.2 MLME-MESHPOWERMGT.request

6.3.74.2.1 Function

This primitive requests a change in the mesh STAs mesh power mode for the mesh peering.

6.3.74.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MESHPOWERMGT.request}(\text{PeerMACAddress}, \text{Mesh Power Mode})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the mesh power mode is changed.</td>
</tr>
<tr>
<td>Mesh Power Mode</td>
<td>Enumeration</td>
<td>ACTIVE_MODE, LIGHT_SLEEP_MODE, DEEP_SLEEP_MODE</td>
<td>Specifies the mesh power mode that the local mesh STA is using for the mesh peering.</td>
</tr>
</tbody>
</table>

6.3.74.2.3 When generated

The primitive is generated when the mesh entity wishes to change its mesh power mode for a mesh peering.

6.3.74.2.4 Effect of receipt

This primitive initiates the local mesh STA’s mesh power mode change for the mesh peering. The MLME subsequently issues an MLME-MESHPOWERMGT.confirm that reflects the results.

6.3.74.3 MLME-MESHPOWERMGT.confirm

6.3.74.3.1 Function

This primitive reports the result of a mesh power mode change attempt.

6.3.74.3.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-MESHPOWERMGT.confirm}(\text{PeerMACAddress})
\]
6.3.74.3.3 When generated

This primitive is generated as a result of an MLME-MESHPOWERMGT.request.

6.3.74.3.4 Effect of receipt

The SME is notified of the results of the mesh power mode change for a mesh peering procedure.

6.3.75 Mesh neighbor offset synchronization

6.3.75.1 Introduction

This mechanism manages the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2 MLME-MESHNEIGHBOROFFSETSYN CSTART.request

6.3.75.2.1 Function

This primitive requests to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```c
MLME-MESHNEIGHBOROFFSETSYN CSTART.request(
    PeerMACAddress
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which to start the neighbor offset synchronization method.</td>
</tr>
</tbody>
</table>

6.3.75.2.3 When generated

This primitive is generated by the SME to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the neighbor offset synchronization method and the calculation of the TSF timer offset value. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYN CSTART.confirm that reflects the results of this request.

6.3.75.3 MLME-MESHNEIGHBOROFFSETSYN CSTART.confirm

6.3.75.3.1 Function

This primitive reports the results of a mesh neighbor offset synchronization request.
6.3.75.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm(
    PeerMACAddress,
    TSFOffsetValue
)
```

6.3.75.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTART.request and report the TSF offset value.

6.3.75.3.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization request.

6.3.75.4 MLME-MESHNEIGHBOROFFSETCALCULATE.request

6.3.75.4.1 Function

This primitive requests a calculation result of the TSF timer offset value for the specified neighbor STA.

6.3.75.4.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETCALCULATE.request(
    PeerMACAddress
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the neighbor offset synchronization is requested.</td>
</tr>
<tr>
<td>TSFOffsetValue</td>
<td>Integer</td>
<td>$-2^{63}$ to $(2^{63}-1)$</td>
<td>Indicates the TSF offset value with the specified neighbor STA, expressed in two’s complement in $\mu$s.</td>
</tr>
</tbody>
</table>

6.3.75.4.3 When generated

This primitive is generated by the SME to order a calculation of the TSF timer offset value with the specified neighbor STA.

6.3.75.4.4 Effect of receipt

On receipt of this primitive, the MLME receives a Beacon or Probe Response frame and calculates the TSF timer offset value from the received frame. The MLME tries to receive a Beacon frame immediately after the issue of MLME-MESHNEIGHBOROFFSETCALCULATE.request even if the mesh STA does not
listen to the Beacon frame from the specified neighbor STA regularly (i.e., in deep sleep mode toward the specified neighbor STA). The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETCALCULATE.confirm that reflects the results of this request.

6.3.75.5 MLME-MESHNEIGHBOROFFSETCALCULATE.confirm

6.3.75.5.1 Function

This primitive reports the results of a mesh neighbor offset calculation request.

6.3.75.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHNEIGHBOROFFSETCALCULATE.confirm(
    PeerMACAddress,
    TSFOffsetValue
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the Neighbor Offset Measure is requested.</td>
</tr>
<tr>
<td>TSFOffsetValue</td>
<td>Integer</td>
<td>(-2^{53} \text{ to } (2^{53}-1))</td>
<td>Indicates the TSF offset value with the specified neighbor STA, expressed in twos complement in (\mu)s.</td>
</tr>
</tbody>
</table>

6.3.75.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETCALCULATE.request to report a TSF offset value.

6.3.75.5.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset calculation request.

6.3.75.6 MLME-MESHNEIGHBOROFFSETSYNCSTOP.request

6.3.75.6.1 Function

This primitive requests to stop the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.6.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-MESHNEIGHBOROFFSETSYNCSTOP.request(
    PeerMACAddress
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity with which to stop the neighbor offset synchronization method.</td>
</tr>
</tbody>
</table>
6.3.75.6.3 When generated

This primitive is generated by the SME to stop the maintenance of the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.6.4 Effect of receipt

On receipt of this primitive, the MLME stops the neighbor offset synchronization method with the specified peer. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYNCSSTOP.confirm that reflects the results of this request.

6.3.75.7 MLME-MESHNEIGHBOROFFSETSYNCSSTOP.confirm

6.3.75.7.1 Function

This primitive reports the results of a neighbor offset synchronization method stop request.

6.3.75.7.2 Semantics of the service primitive

The primitive parameter is as follows:

| MLME-MESHNEIGHBOROFFSETSYNCSSTOP.confirm( |
| PeerMACAddress |

6.3.75.7.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSSTOP.request.

6.3.75.7.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization stop request.

6.3.76 Mesh TBTT adjustment

6.3.76.1 Introduction

The following primitives describe how a mesh STA requests a TBTT adjustment from a neighboring peer mesh STA.

6.3.76.2 MLME-MESHTBTTADJUSTMENT.request

6.3.76.2.1 Function

This primitive requests transmission of a TBTT Adjustment Request frame.
6.3.76.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-MESHTBTTADJUSTMENT.request(
    PeerMACAddress,
    BeaconTiming,
    VendorSpecificInfo
)
```

6.3.76.2.3 When generated

This primitive is generated by the SME to request that a TBTT Adjustment Request frame be sent to a peer entity to request the adjustment of the peer entity’s TBTT.

6.3.76.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TBTT Adjustment Request frame containing the Beacon Timing elements. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MESHTBTTADJUSTMENT.confirm that reflects the result of this request.

### 6.3.76.3 MLME-MESHTBTTADJUSTMENT.confirm

#### 6.3.76.3.1 Function

This primitive reports the result of a mesh TBTT adjustment request.

#### 6.3.76.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-MESHTBTTADJUSTMENT.confirm(
    PeerMACAddress,
    ResultCode,
    BeaconTiming,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the TBTT Adjustment Request is sent.</td>
</tr>
<tr>
<td>BeaconTiming</td>
<td>A set of Beacon Timing elements</td>
<td>As defined in 8.4.2.107</td>
<td>A set of Beacon Timing elements of the mesh STA.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the TBTT Adjustment Response is received.</td>
</tr>
</tbody>
</table>
### 6.3.76.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHTBTTADJUSTMENT.request primitive to indicate the result of that request.

### 6.3.76.3.4 Effect of receipt

The SME is notified of the result of the mesh TBTT adjustment request.

### 6.3.76.4 MLME-MESHTBTTADJUSTMENT.indication

#### 6.3.76.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting adjustment of the TBTT.

#### 6.3.76.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-MESHTBTTADJUSTMENT.indication(
    PeerMACAddress,  
    BeaconTiming,  
    VendorSpecificInfo  
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResultCode</td>
<td>Enumeration</td>
<td>SUCCESS, REFUSED_REASON_UNSPECIFIED, CANNOT_FIND_ALTERNATIVE_TBTT</td>
<td>Indicates the result of the TBTT adjustment request.</td>
</tr>
<tr>
<td>BeaconTiming</td>
<td>A set of Beacon Timing elements</td>
<td>As defined in 8.4.2.107</td>
<td>A set of Beacon Timing elements of the responding mesh STA. Present only when such an element was present in the TBTT Adjustment Response frame.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

#### 6.3.76.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a TBTT Adjustment Request frame from the specified peer MAC entity.
6.3.76.4.4 Effect of receipt

The SME is notified of the receipt of the TBTT adjustment request by the specified peer MAC entity. The mesh STA that received this primitive subsequently processes the TBTT scanning and adjustment procedure described in 13.13.4.4.3, and responds with the MLME-MESHTBTTADJUSTMENT.response.

6.3.76.5 MLME-MESHTBTTADJUSTMENT.response

6.3.76.5.1 Function

This primitive is used to send a response to the specified peer MAC entity that requested a TBTT adjustment from the mesh STA that issued this primitive.

6.3.76.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHTBTTADJUSTMENT.response( 
PeerMACAddress, 
Status Code, 
BeaconTiming, 
VendorSpecificInfo 
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the TBTT Adjustment Response is sent.</td>
</tr>
<tr>
<td>Status Code</td>
<td>As defined in frame format</td>
<td>SUCCESS, REFUSED_REASON_UNSPECIFIED, CANNOT_FIND_ALTERNATIVE_TBTT</td>
<td>Indicates the result response to the TBTT adjustment request from the peer mesh STA.</td>
</tr>
<tr>
<td>BeaconTiming</td>
<td>A set of Beacon Timing elements</td>
<td>As defined in 8.4.2.107</td>
<td>A set of Beacon Timing elements of the mesh STA. Present only when the STA could not find an alternative TBTT.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.76.5.3 When generated

This primitive is generated by the SME of a mesh STA as response to an MLME-MESHTBTTADJUSTMENT.indication primitive.

6.3.76.5.4 Effect of receipt

This primitive initiates the transmission of a TBTT Adjustment Response frame to the peer MAC entity that requested the TBTT adjustment.

On receipt of this primitive, the MLME constructs a TBTT Adjustment Response frame. This frame is then scheduled for transmission.
6.3.77 MCCA management interface

6.3.77.1 Introduction

The following primitives describe how a mesh entity manages its MCCA operation.

6.3.77.2 MLME-ACTIVATEMCCA.request

6.3.77.2.1 Function

This primitive requests that the MAC entity activate MCCA.

6.3.77.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ACTIVATEMCCA.request(
    MCCAScanDuration,
    MAFLimit,
    MCCAAdvertPeriodMax,
    MCCAMaxTrackStates,
    MCCACWmin,
    MCCACWmax,
    MCCAAIFSN
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCCAScanDuration</td>
<td>Integer</td>
<td>0 – 65 535</td>
<td>Specifies the duration in TUs that the mesh STA shall not initiate or accept MCCA Setup Request frames.</td>
</tr>
<tr>
<td>MAFLimit</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the maximum MCCA access fraction allowed at the mesh STA. This number is always a multiple of (1/255) of the DTIM Interval.</td>
</tr>
<tr>
<td>MCCAAdvertPeriodMax</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the maximum interval that a mesh STA with dot11MCCAActivated equal to true waits for an MCCAOP advertisement. It is expressed in number of DTIM intervals.</td>
</tr>
<tr>
<td>MCCAMaxTrackStates</td>
<td>Integer</td>
<td>dot11MCCAMinTrackStates – 65 535</td>
<td>Specifies the total number of MCCAOP reservations that the MAC entity is able to track.</td>
</tr>
<tr>
<td>MCCACWmin</td>
<td>Integer</td>
<td>0–15</td>
<td>Specifies the value of the minimum size of the contention window that the MAC entity uses for channel access during an MCCAOP.</td>
</tr>
<tr>
<td>MCCACWmax</td>
<td>Integer</td>
<td>0–63</td>
<td>Specifies the value of the maximum size of the contention that the MAC entity uses for channel access during an MCCAOP.</td>
</tr>
<tr>
<td>MCCAAIFSN</td>
<td>Integer</td>
<td>0–15</td>
<td>Specifies the value of the AIFSN that the MAC entity uses for channel access during an MCCAOP.</td>
</tr>
</tbody>
</table>

6.3.77.2.3 When generated

This primitive is generated by the SME to start the use of MCCA.

6.3.77.2.4 Effect of receipt

This primitive sets dot11MCCAActivated to true and initializes the MCCA parameters.
6.3.77.3 MLME-MCCASETPRP.request

6.3.77.3.1 Function

This primitive requests that the MAC entity set up an MCCAOP reservation.

6.3.77.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MLME-MCCASETPRP.request(
    MCCAOPDuration,
    MCCAOPPeriodicity,
    MCCAOPOffset,
    MCCAOPResponder,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCCAOPDuration</td>
<td>Integer</td>
<td>0 – 65 535</td>
<td>Specifies the MCCAOP Duration of the needed MCCAOPs as described in 8.4.2.108.2.</td>
</tr>
<tr>
<td>MCCAOPPeriodicity</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the MCCAOP Periodicity of the needed MCCAOPs as described in 8.4.2.108.2.</td>
</tr>
<tr>
<td>MCCAOPOffset</td>
<td>Integer</td>
<td>0 – 16 777 215</td>
<td>Specifies the MCCAOP offset of the needed MCCAOPs as described in 8.4.2.108.2.</td>
</tr>
<tr>
<td>MCCAOPResponder</td>
<td>MAC address</td>
<td>Any valid individual or group MAC address</td>
<td>Specifies the MAC address of the intended MCCAOP responder.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.77.3.3 When generated

This primitive is generated by the SME to start an MCCAOP setup procedure.

6.3.77.3.4 Effect of receipt

This primitive causes the transmission of an MCCA Setup Request frame to the MCCAOP responder provided that the conditions for the transmission are met. The MLME subsequently issues an MLME-MCCASETPRP.confirm primitive that reflects the results.

6.3.77.4 MLME-MCCASETPRP.confirm

6.3.77.4.1 Function

This primitive is generated by the MLME to report the result of an MLME-MCCASETPRP.request primitive, which was issued in order to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPResponder.

6.3.77.4.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME-MCCASETUP.confirm(
  MCCAOPParameters,
  MCCAOPID,
  MCCAOPResponder,
  ResultCode,
  VendorSpecificInfo
)
6.3.77.5.3 When generated

This primitive is generated by the MLME as result of the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.77.5.4 Effect of receipt

The SME is notified of the request to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPOwner.

6.3.77.6 MLME-MCCASETUP.response

6.3.77.6.1 Function

This primitive is used to send a response to the peer MAC entity specified in MCCAOPOwner that requested the set up of the MCCAOP reservation.

6.3.77.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCASETUP.response( 
MCCAOPParameters, 
MCCAOPID, 
MCCAOPOwner, 
resultCode, 
VendorSpecificInfo 
)

<table>
<thead>
<tr>

<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>
6.3.77.6.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCASETUP.indication procedure.

6.3.77.6.4 Effect of receipt

This primitive initiates transmission of a response to the peer MAC entity specified in the MCCAOPOwner that requested the set up of an MCCAOP reservation.

6.3.77.7 MLME-MCCAADVERTISEMENT.request

6.3.77.7.1 Function

This primitive requests that the MAC entity request an MCCAOP advertisement from the specified peer MAC entity by sending an MCCA Advertisement Request frame to the peer MAC entity.

6.3.77.7.2 Semantics of the service primitive

The primitive parameters are as follows:

\[\text{MLME-MCCAADVERTISEMENT.request(}\]
\[\text{PeerMACAddress,}\]
\[\text{VendorSpecificInfo}\]
\[\text{)}\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the peer MAC that will send the Advertisement.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.77.7.3 When generated

This primitive is generated by the SME to request an MCCAOP advertisement from the specified peer MAC entity.

6.3.77.7.4 Effect of receipt

This primitive causes the transmission of an MCCA Advertisement Request frame to the specified peer MAC entity. The MLME subsequently issues an MLME-MCCAADVERTISEMENT.confirm primitive that reflects the results.

6.3.77.8 MLME-MCCAADVERTISEMENT.confirm

6.3.77.8.1 Function

This primitive reports the result of an MLME-MCCAADVERTISEMENT.request.

6.3.77.8.2 Semantics of the service primitive

The primitive parameters are as follows:

\[\text{MLME-MCCAADVERTISEMENT.confirm(}\]

6.3.77.8.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCAADVERTISEMENT.request.

6.3.77.8.4 Effect of receipt

The SME is notified of the results of the MCCA Advertisement Request frame.

6.3.77.9 MLME-MCCAADVERTISEMENT.indication

6.3.77.9.1 Function

This primitive reports that an MCCA Advertisement Request frame has been received from the specified peer MAC entity.

6.3.77.9.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME-MCCAADVERTISEMENT.indication(
PeerMACAddress,
VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the transmitter of the MCCA Advertisement Request frame.</td>

<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.77.9.3 When generated

This primitive is generated by the MLME upon receipt of an MCCA Advertisement Request frame from the specified peer MAC entity.
6.3.77.9.4 Effect of receipt

The SME is notified of the request to advertise its MCCAOP reservations.

6.3.77.10 MLME-MCCAADVERTISEMENT.response

6.3.77.10.1 Function

This primitive requests that the MAC entity respond to the MCCAOP advertisement request from the specified peer MAC entity by sending an MCCA Advertisement frame to the peer MAC entity.

6.3.77.10.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MCCAADVERTISEMENT.response}(
\quad \text{MCCAOPAdvertisement},
\quad \text{PeerMACAddress},
\quad \text{ResultCode},
\quad \text{VendorSpecificInfo}
\)
\]

<table>
<thead>

<td>Indicates the result of the MLME-MCCAADVERTISEMENT.response.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.77.10.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCAADVERTISEMENT.indication procedure.

6.3.77.10.4 Effect of receipt

This primitive initiates transmission of a response to the specified peer MAC entity that requested advertisement of the MCCAOP reservations.

6.3.77.11 MLME-MCCATEARDOWN.request

6.3.77.11.1 Function

This primitive requests that the MAC entity tear down an MCCAOP reservation.

6.3.77.11.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MCCATEARDOWN.request}(
\quad \text{Name}
\quad \text{Type}
\quad \text{Valid range}
\quad \text{Description}
\)
\]
MCCAOPID, PeerMACAddress)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCCAOPID</td>
<td>Integer</td>
<td>0–255</td>
<td>Specifies the MCCAOP reservation ID of the MCCAOP reservation to be torn down.</td>

<tr>
<td>PeerMACAddress</td>
<td>MAC address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the peer MAC for the MCCAOP reservation.</td>
</tr>
</tbody>
</table>

6.3.77.11.3 When generated

This primitive is generated by the SME to start an MCCAOP teardown procedure.

6.3.77.11.4 Effect of receipt

This primitive causes the teardown MCCAOP reservation identified by means of the MCCAOP reservation ID in MCCAOPID, and the transmission of an MCCA Teardown frame to the peer MAC entity in PeerMACAddress.

6.3.77.12 MLME-MCCATEARDOWN.indication

6.3.77.12.1 Function

This primitive reports that an MCCA Teardown frame has been received from the specified peer MAC entity.

6.3.77.12.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCATEARDOWN.indication(
    MCCAOPID, PeerMACAddress
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCCAOPID</td>
<td>Integer</td>
<td>0–255</td>
<td>MCCAOP reservation ID of the MCCAOP reservation to be torn down.</td>
</tr>
<tr>
<td>PeerMACAddress</td>
<td>MAC address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the MAC address of the peer MAC for the MCCAOP reservation.</td>
</tr>
</tbody>
</table>

6.3.77.12.3 When generated

This primitive is generated by the MLME as result of receipt of a MCCA Teardown frame.

6.3.77.12.4 Effect of receipt

The SME is notified of the request to start an MCCAOP teardown procedure.
6.3.78 MBSS congestion control

6.3.78.1 Introduction

The following primitives describe how a mesh STA manages its congestion control operation.

6.3.78.2 MLME-MBSSCONGESTIONCONTROL.request

6.3.78.2.1 Function

This primitive requests that the MAC entity notify the peer MAC entity on the congestion level or requests to traffic generation by transmitting a Congestion Control Notification frame to the specified peer MAC entity.

6.3.78.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MBSSCONGESTIONCONTROL.request(}
\begin{align*}
\text{PeerMACAddress,} \\
\text{CongestionNotification,} \\
\text{VendorSpecificInfo}
\end{align*}
\)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity to which the Congestion Control Notification frame is sent.</td>
</tr>
<tr>
<td>CongestionNotification</td>
<td>A set of Congestion Notification elements</td>
<td>As defined in 8.4.2.103</td>
<td>Congestion notification information generated by the mesh STA.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.78.2.3 When generated

The SME generates this primitive to request that the MAC notify its peer MAC about the current congestion level.

6.3.78.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Congestion Control Notification frame. This frame is then scheduled for transmission.

6.3.78.3 MLME-MBSSCONGESTIONCONTROL.indication

6.3.78.3.1 Function

This primitive indicates that a congestion notification has been received.

6.3.78.3.2 Semantics of the service primitive

The primitive parameters are as follows:
MLME- MBSSCONGESTIONCONTROL.indication(
    PeerMACAddress,
    CongestionNotification,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the Congestion Control Notification frame was received.</td>
</tr>
<tr>
<td>CongestionNotification</td>
<td>A set of Congestion Notification elements</td>
<td>As defined in 8.4.2.103</td>
<td>Congestion notification information contained in the received Congestion Control Notification frame.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.78.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Congestion Control Notification frame from a specific peer MAC entity.

6.3.78.3.4 Effect of receipt

The SME is notified of the results of the receipt of the congestion control notification from the specified peer MAC entity. The mesh STA that received this primitive subsequently activates the local rate control as described in 13.12.

6.3.79 MBSS proxy update

6.3.79.1 Introduction

The following primitives describe how a mesh STA reports the proxy update information to another mesh STA in the MBSS.

6.3.79.2 MLME-MBSSPROXYUPDATE.request

6.3.79.2.1 Function

This primitive requests that the MAC entity inform a destination mesh STA about its proxy information by transmitting a Proxy Update frame to the specified peer MAC entity.

6.3.79.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSPROXYUPDATE.request(
    PeerMACAddress,
    ProxyUpdate,
    VendorSpecificInfo
)
6.3.79.2.3 When generated

This primitive is generated by the SME to request that a Proxy Update frame be sent to the specified peer MAC entity.

6.3.79.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Proxy Update frame containing the PXU element. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MBSSPROXYUPDATE.confirm that reflects the results of this request.

6.3.79.3 MLME-MBSSPROXYUPDATE.confirm

6.3.79.3.1 Function

This primitive reports the results of a proxy update request.

6.3.79.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MBSSPROXYUPDATE.confirm(
  PeerMACAddress,
  ProxyUpdateConfirmation,
  VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the Proxy Update Confirmation frame is received.</td>
</tr>
<tr>
<td>ProxyUpdateConfirmation</td>
<td>A set of PXU elements</td>
<td>As defined in 8.4.2.119</td>
<td>A set of proxy update confirmation information from the peer MAC entity to which the Proxy Update frame was sent.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.79.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MBSSPROXYUPDATE.request primitive.
6.3.79.3.4 Effect of receipt

The SME is notified of the results of the MBSS proxy update request.

6.3.79.4 MLME-MBSSPROXYUPDATE.indication

6.3.79.4.1 Function

This primitive indicates that an update of the proxy information has been received from a specific peer MAC entity.

6.3.79.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.indication(
    PeerMACAddress,
    ProxyUpdate,
    VendorSpecificInfo
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the update of the proxy information was received.</td>
</tr>
<tr>
<td>ProxyUpdate</td>
<td>A set of PXU elements</td>
<td>As defined in 8.4.2.118</td>
<td>A set of proxy information received from the peer mesh STA.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.79.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Proxy Update frame from a specific peer MAC entity.

6.3.79.4.4 Effect of receipt

The SME is notified of the results of the receipt of the proxy update request by the specified peer MAC entity. The mesh STA that received this primitive subsequently updates the proxy information as described in 13.11.4.3.

6.3.79.5 MLME-MBSSPROXYUPDATE.response

6.3.79.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that sent an update of the proxy information to the mesh STA that issued this primitive.

6.3.79.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.response(
    PeerMACAddress,
    ProxyUpdateConfirmation,
)
```
6.3.79.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MBSSPROXYUPDATE.indication primitive.

6.3.79.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that sent an update of the proxy information.

On receipt of this primitive, the MLME constructs a Proxy Update Confirmation frame. The frame contains one or more PXUC elements. This frame is then scheduled for transmission.

6.3.80 MBSS mesh gate announcement

6.3.80.1 Introduction

The following primitives describe how a mesh STA announces mesh gate reachability.

6.3.80.2 MLME-MBSSGATEANNOUNCEMENT.request

6.3.80.2.1 Function

This primitive requests that the MAC entity update the mesh gate information by transmitting a Gate Announcement frame to the specified MAC entity.

6.3.80.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
MLME-MBSSGATEANNOUNCEMENT.request(
    PeerMACAddress,
    GateAnnouncement,
    VendorSpecificInfo
)
```
6.3.80.2.3 When generated

This primitive is generated by the SME to request that a Gate Announcement frame be sent to the specified MAC entity.

6.3.80.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Gate Announcement frame containing the GANN element. This frame is then scheduled for transmission following the interval specified by dot11MeshGateAnnouncementInterval.

6.3.80.3 MLME-MBSSGATEANNOUNCEMENT.indication

6.3.80.3.1 Function

This primitive indicates that a mesh gate announcement has been received from the specific peer MAC entity.

6.3.80.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MBSSGATEANNOUNCEMENT.indication(
    PeerMACAddress,
    GateAnnouncement,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the gate announcement was received.</td>
</tr>
<tr>
<td>GateAnnouncement</td>
<td>GANN element</td>
<td>As defined in 8.4.2.113</td>
<td>A set of gate announcement information contained in the received Gate Announcement frame.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.80.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Gate Announcement frame from a specific peer MAC entity.
6.3.80.3.4 Effect of receipt

The SME is notified of the reachability to a mesh gate in the mesh BSS. The mesh STA received this primitive subsequently triggers MBSSGATEANNOUNCEMENT.request as described in 13.11.2.

6.3.81 Mesh link metric

6.3.81.1 Introduction

Subclause 6.3.81 describes the management procedures associated with mesh link metric reporting.

6.3.81.2 MLME-MESHLINKMETRICREAD.request

6.3.81.2.1 Function

This primitive requests to read a link metric value between the local MAC entity and a specific peer MAC entity.

6.3.81.2.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MLME-MESHLINKMETRICREAD.request}(
\text{PeerMACAddress}
)\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity for which the link metric value is read</td>
</tr>
</tbody>
</table>

6.3.81.2.3 When generated

This primitive is generated by the SME to read the link metric value for the mesh link to the specified peer MAC entity.

6.3.81.2.4 Effect of receipt

On receipt of this primitive, the MLME reports the link metric value. The MLME subsequently issues an MLME-MESHLINKMETRICREAD.confirm that reflects the results of this request.

6.3.81.3 MLME-MESHLINKMETRICREAD.confirm

6.3.81.3.1 Function

This primitive reports the results of a link metric read request.

6.3.81.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-MESHLINKMETRICREAD.confirm}(
\begin{array}{l}
\text{LinkMetricValue}, \\
\text{VendorSpecificInfo}
\end{array} 
)\]
6.3.81.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHLINKMETRICREAD.request primitive to request a link metric value.

6.3.81.3.4 Effect of receipt

The SME is notified of the results of the link metric read request.

6.3.81.4 MLME-MESHLINKMETRICREPORT.request

6.3.81.4.1 Function

This primitive requests that the MAC entity either transmit a link metric to or request a link metric from the specified peer MAC entity.

6.3.81.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHLINKMETRICREPORT.request(
    PeerMACAddress,
    LinkMetricRequestFlag,
    MeshLinkMetricReport,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LinkMetricValue</td>
<td>Mesh Link Metric Report element</td>
<td>As defined in 8.4.2.102</td>
<td>The link metric value for the mesh link to the specified peer MAC entity.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.81.4.3 When generated

This primitive is generated by the SME to request that a Mesh Link Metric Report frame be sent to a peer MAC entity in order to report a link metric value and to request a mesh link metric report from the peer MAC entity if LinkMetricRequestFlag is equal to REPORT_AND_REQUEST.
6.3.81.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Link Metric Report frame. The Request subfield in the Flags field of the Mesh Link Metric Report element is set depending on the parameter given by the LinkMetricRequestFlag. If LinkMetricRequestFlag is equal to REPORT_ONLY, the Request subfield is set to 0. If LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the Request subfield is set to 1. This frame is then scheduled for transmission.

6.3.81.5 MLME-MESHLINKMETRICREPORT.indication

6.3.81.5.1 Function

This primitive indicates that a Mesh Link Metric Report frame has been received from a peer MAC entity. This Mesh Link Metric Request Report can be in response to an earlier MLME-MESHLINKMETRICREPORT.request primitive with LinkMetricRequestFlag equal to REPORT_AND_REQUEST.

6.3.81.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MESHLINKMETRICREPORT.indication(
    PeerMACAddress,
    LinkMetricRequestFlag,
    MeshLinkMetricReport,
    VendorSpecificInfo
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the Mesh Link Metric Report frame was received.</td>
</tr>
<tr>
<td>LinkMetricRequestFlag</td>
<td>Enumeration</td>
<td>REPORT_ONLY, REPORT_AND_REQUEST</td>
<td>Indicates whether the peer MAC entity requests a link metric report.</td>
</tr>
<tr>
<td>MeshLinkMetricReport</td>
<td>Mesh Link Metric Report element</td>
<td>As defined in 8.4.2.102</td>
<td>A metric value reported from the specified peer MAC entity.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.81.5.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Link Metric Report frame from a specific peer MAC entity.

6.3.81.5.4 Effect of receipt

The SME is notified of the receipt of the link metric report from the specified peer MAC entity. When LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the mesh STA responds with a Mesh Link Metric Report frame.
6.3.82 HWMP mesh path selection

6.3.82.1 Introduction

The following primitives describe how a mesh STA establishes and maintains a mesh path to a specified peer MAC entity.

6.3.82.2 MLME-HWMPMESHPATHSELECTION.request

6.3.82.2.1 Function

This primitive requests that the MAC entity establish or maintain a mesh path to the specified peer MAC entity by transmitting an HWMP Mesh Path Selection frame to the specified peer MAC entity.

6.3.82.2.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MLME-HWMPMESHPATHSELECTION.request(}
\begin{align*}
\text{PeerMACAddress,} \\
\text{RootAnnouncement,} \\
\text{PathRequest,} \\
\text{PathReply,} \\
\text{PathError,} \\
\text{VendorSpecificInfo}
\end{align*}
\)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual or group MAC address</td>
<td>Specifies the address of the peer MAC entity to which the HWMP Mesh Path Selection frame is sent.</td>
</tr>
<tr>
<td>RootAnnouncement</td>
<td>RANN element</td>
<td>As defined in 8.4.2.114</td>
<td>A set of RANN elements generated by the mesh STA. Present only if the mesh STA is configured as a root mesh STA using the proactive RANN mechanism [dot11MeshHWMPRootMode = rann (4)], and as described in 13.10.12.</td>
</tr>
<tr>
<td>PathRequest</td>
<td>PREQ element</td>

<tr>
<td>PathError</td>
<td>PERR element</td>
<td>As defined in 8.4.2.117</td>
<td>A set of PERR elements generated by the mesh STA. Present as described in 13.10.11.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.82.2.3 When generated

This primitive is generated by the SME to request that an HWMP Mesh Path Selection frame be sent to a specified peer entity.
6.3.82.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HWMP Mesh Path Selection frame. This frame is then scheduled for transmission.

6.3.82.3 MLME-HWMPMESHPATHSELECTION.indication

6.3.82.3.1 Function

This primitive indicates that an HWMP Mesh Path Selection frame has been received from the specified peer MAC entity.

6.3.82.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[\text{MLME-HWMPMESHPATHSELECTION.indication(}\]
\[\text{PeerMACAddress,}\]
\[\text{RootAnnouncement,}\]
\[\text{PathRequest,}\]
\[\text{PathReply,}\]
\[\text{PathError,}\]
\[\text{VendorSpecificInfo}\]
\[\text{)}\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeerMACAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC address</td>
<td>Specifies the address of the peer MAC entity from which the HWMP Mesh Path Selection frame was received.</td>
</tr>
<tr>
<td>RootAnnouncement</td>
<td>RANN element</td>
<td>As defined in 8.4.2.114</td>
<td>A set of RANN elements contained in the received frame. Present only when such an element was present in the received frame.</td>

<td>As defined in 8.4.2.115</td>
<td>A set of PREQ elements contained in the received frame. Present only when such an element was present in the received frame.</td>
</tr>
<tr>
<td>PathReply</td>
<td>PREP element</td>
<td>As defined in 8.4.2.116</td>
<td>A set of PREP elements contained in the received frame. Present only when such an element was present in the received frame.</td>
</tr>
<tr>
<td>PathError</td>
<td>PERR element</td>
<td>As defined in 8.4.2.117</td>
<td>A set of PERR elements contained in the received frame. Present only when such an element was present in the received frame.</td>
</tr>
<tr>
<td>VendorSpecificInfo</td>
<td>A set of elements</td>
<td>As defined in 8.4.2.28</td>
<td>Zero or more elements.</td>
</tr>
</tbody>
</table>

6.3.82.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of an HWMP Mesh Path Selection frame from a specific peer MAC entity.
6.3.82.3.4 Effect of receipt

The SME is notified of the results of the receipt of the HWMP Mesh Path Selection from the specified peer MAC entity. The mesh STA received this primitive subsequently activates path selection procedures described in 13.10.

6.4 MAC state generic convergence function (MSGCF)

6.4.1 Overview of the convergence function

The MSGCF and its interaction with other management entities is defined in 6.4. The MSGCF correlates information exchanged between the MAC management entities regarding the state of an IEEE 802.11 interface and converges this information into events and status for consumption by higher layer protocols. Non-AP STAs when dot11MSGCFActivated is set to true shall support the MSGCF procedures in this clause; APs do not support the MSGCF.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME_SAP and PLME_SAP respectively, as well as with the SME via the MSGCF-SME_SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

The MSGCF operates at the level of an IEEE 802.11 ESS, and generates events based on the state of the link between a non-AP STA and an ESS. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and does not change state in the state machine defined within this clause.

6.4.2 Overview of convergence function state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 6-26. Because Figure 6-26 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

6.4.3 Convergence function state list

6.4.3.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA remains in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

6.4.3.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.
6.4.3.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link may be due to explicit disassociation by the peer, the imminent invalidation of cryptographic keys because of usage limits (such as sequence counter exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

6.4.3.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other IEEE 802.11 STAs.
6.4.4 Convergence function state transitions

6.4.4.1 Transitions to ESS_CONNECTED

6.4.4.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA will have completed the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE 802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-Link-Up.indication primitive to higher layers.

6.4.4.1.2 From ESS_DISENGAGING

To make this transition, the SME cancels a previous event that predicted an ESS link failure. This may be due to network parameters indicating renewed link strength or a successful renewal of an expiring RSN SA. When this transition is complete, the MSGCF sends an MSGCF-ESS-Link-Event-Rollback.indication event to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also issues an MSGCF-ESS-Link-Threshold-Report.indication to higher layers.

6.4.4.2 Transitions to ESS_DISCONNECTED

6.4.4.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that RSN keys expired and could not be renewed. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

6.4.4.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

6.4.4.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

6.4.4.3 Transitions to ESS_DISENGAGING

6.4.4.3.1 From ESS_CONNECTED

When the parameters as defined in Table 6-7 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-Link-Going-Down event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-Link-Threshold-Report.indication is also issued to higher layers.

6.4.4.4 Transitions to STANDBY

6.4.4.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.
6.4.5 Convergence function informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in Figure 6-26. Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-Link-Command.request primitive.

6.4.6 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to one when the non-AP STA leaves the STANDBY state.

6.4.7 ESS status reporting

6.4.7.1 MSGCF-ESS-Link-Up

6.4.7.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

6.4.7.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Up.indication(
    NonAPSTAMacAddress,
    ESSIdentifier
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS has become available.</td>
</tr>
<tr>
<td>ESSIDIdentifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B35].</td>
</tr>
</tbody>
</table>

6.4.7.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange data frames. The generation of this primitive may vary depending on the contents of dot11WEPDefaultKeysTable and dot11WEPKeyMappingsTable and the setting of dot11RSNAOptionImplemented.

If there are no entries in the dot11WEPDefaultKeysTable, no entry for the current AP in dot11WEPKeyMappingsTable, and dot11RSNAOptionImplemented is false, then the network does not use
encryption. This event is generated upon receipt of an MLME-ASSOCIATE.confirm message with a result code of success.

If there are entries in the dot11WEPDefaultKeysTable, or an entry for the current AP in dot11WEPKeyMappingsTable, or dot11IRSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange data frames, the convergence function receives an MLME-ASSOCIATE.confirm primitive with a result code of success and the SME emits an MLME-SETKEYS.request primitive. The latter primitive is used to determine that a WEP key is available, or that the RSN 4-Way Handshake has completed.

This event is not triggered by MLME-REASSOCIATE.confirm messages because MLME-REASSOCIATE.confirm messages are defined as transitions within the same ESS.

The MLME-ASSOCIATE.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

6.4.7.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

6.4.7.2 MSGCF-ESS-Link-Down.indication

6.4.7.2.1 Function

This event is triggered to indicate that an IEEE 802.11 ESS is no longer available for sending frames.

6.4.7.2.2 Semantics of the service primitive

The event’s parameters are as follows:

```plaintext
MSGCF-ESS-Link-Down.indication (NonAPSTAMacAddress, ESSIDIdentifier, ReasonCode )
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MAC Address</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is no longer available.</td>
</tr>
<tr>
<td>ESSIDIdentifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>ReasonCode</td>
<td>Enumerated</td>
<td>EXPLICIT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC</td>
<td>Reason code, drawn from Table 6-2.</td>
</tr>
</tbody>
</table>
6.4.7.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-DEAUTHENTICATE.indication or an MLME-DISASSOCIATE.indication primitive message. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to confirm that a non-AP STA is unable to reassociate with any alternate AP within the ESS.

6.4.7.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

6.4.7.3 MSGCF-ESS-Link-Going-Down

6.4.7.3.1 Function

This event is triggered to indicate the expectation that IEEE 802.11 ESS will no longer be available for sending frames in the near future.

6.4.7.3.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-Link-Going-Down.indication(  
    NonAPSTAMacAddress,  
    ESSIdentifier,  
    EventID,  
    TimeInterval,  
    ReasonCode  
)
```

Table 6-2—Reason codes for network down

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPLICIT_DISCONNECT</td>
<td>An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA’s current serving AP and the non-AP STA was unable to Reassociate with an alternate AP in the same ESS.</td>
</tr>
<tr>
<td>KEY_EXPIRATION</td>
<td>Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.</td>
</tr>
<tr>
<td>LOW_POWER</td>
<td>If the SME reports that the IEEE 802.11 interface was shut down to conserve power, that event may be reported to higher level protocols.</td>
</tr>
<tr>
<td>VENDOR_SPECIFIC</td>
<td>Vendor-specific usage.</td>
</tr>
</tbody>
</table>
6.4.7.3.3 When generated

This notification is generated by the MSGCF when the IEEE 802.11 ESS link is currently established and is expected to go down within the specified time interval. The network may be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME_SAP. It may also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols may require different levels of advance notice, and may configure the dot11ESSLinkDownTimeInterval attribute accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported (e.g., RSSI in Clause 15), it is not applied.

</tbody>
</table>
6.4.7.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

6.4.7.4 MSGCF-ESS-Link-Event-Rollback.indication

6.4.7.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

6.4.7.4.2 Semantics of the service primitive

The event parameters are as follows:

\[
\text{MSGCF-ESS-Link-Event-Rollback.indication}(
\text{NonAPSTAMacAddress, ESSIDIdentifier, EventID})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>

<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>EventID</td>
<td>Integer</td>
<td>N/A</td>
<td>An integer used to identify the event that is used in the case of event rollback.</td>
</tr>
</tbody>
</table>

6.4.7.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

MSGCF-ESS-Link-Event-Rollback.indication is used in conjunction with MSGCF-ESS-Link-Going-Down. MSGCF-ESS-Link-Event-Rollback.indication events are issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

6.4.7.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include cancelling any handover procedures started by the MSGCF-ESS-Link-Going-Down event.

6.4.7.5 MSGCF-ESS-Link-Detected.indication

6.4.7.5.1 Function

This event reports on the presence of a new IEEE 802.11 ESS.
6.4.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Detected.indication(
    NonAPSTAMacAddress,
    ESSIDIdentifier,
    ESSDescription
)
```

<table>
<thead>

</tr>
<tr>
<td>Vendor_Specific_Trigger_Support</td>
<td>This network supports a vendor-specific trigger service.</td>
</tr>
</tbody>
</table>

6.4.7.5.3 When generated

Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in the MIB in the dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of...
BSSIDs within the network, as well as indications of support for MIH. Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. Each entry in the table is held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

6.4.7.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.7.6 MSGCF-ESS-Link-Scan.request

6.4.7.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

6.4.7.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```plaintext
MSGCF-ESS-Link-Scan.request(
    SSID,
    HESSID,
    AccessNetworkType
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSID</td>
<td>Octet string</td>
<td>0–32 octets</td>
<td>Specific or wildcard.</td>
</tr>
<tr>
<td>HESSID</td>
<td>As defined in 8.4.2.94</td>
<td>As defined in 8.4.2.94</td>
<td>The HESSID to search for. It can be set to all 1s for use as a wildcard to match all available HESSID values.</td>
</tr>
<tr>
<td>AccessNetworkType</td>
<td>As defined in 8.4.2.94</td>
<td>As defined in 8.4.2.94</td>
<td>This may be a specific value to match one type of networks, or all 1s to match all access network types.</td>
</tr>
</tbody>
</table>

6.4.7.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

6.4.7.6.4 Effect of receipt

The SME generates a corresponding MLME-SCAN.request primitive to find available networks.

6.4.7.7 MSGCF-ESS-Link-Scan.confirm

6.4.7.7.1 Function

This function reports information on available ESSs to higher protocol layers.
6.4.7.7.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MSGCF-ESS-Link-Scan.confirm(}
\text{NonAPSTAMacAddress,}
\text{ESSIdentifiers,}
\text{ESSDescriptions}
\text{)}
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting the new network.</td>
</tr>
<tr>
<td>ESSIdentifiers</td>
<td>Set of Strings</td>
<td>N/A</td>
<td>An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>ESSDescriptions</td>
<td>Set of ESSDescriptions, as defined in Table 6-4</td>
<td>N/A</td>
<td>A set of information about each discovered ESS.</td>
</tr>
</tbody>
</table>

6.4.7.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-Link-Scan.request primitive.

6.4.7.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.8 Network configuration

6.4.8.1 MSGCF-ESS-Link-Capability.request

6.4.8.1.1 Function

This primitive requests a list of the capabilities supported by a network.

6.4.8.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MSGCF-ESS-Link-Capability.request(}
\text{NonAPSTAMacAddress,}
\text{ESSIdentifier}
\text{)}
\]
6.4.8.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

6.4.8.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-Link-Capability.confirm primitive.

6.4.8.2 MSGCF-ESS-Link-Capability.confirm

6.4.8.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

6.4.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Capability.confirm(
    NonAPSTAMacAddress, 
    ESSIDIdentifier, 
    EssLinkParameterSet, 
    ReasonCode
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting the new network.</td>
</tr>
<tr>
<td>ESSIDIdentifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>EventCapabilitySet</td>
<td>As defined in Table 6-6</td>
<td>N/A</td>
<td>list of supported events.</td>
</tr>
<tr>
<td>ReasonCode</td>
<td>Enumerated</td>
<td>SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES</td>
<td>An error code, if applicable.</td>
</tr>
</tbody>
</table>
6.4.8.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-Link-Capability.request primitive to report whether specific events are supported.

6.4.8.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

6.4.8.3 MSGCF-Set-ESS-Link-Parameters.request

6.4.8.3.1 Function

This primitive sets thresholds for reporting of network events.

6.4.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MSGCF-Set-ESS-Link-Parameters.request(} \\
\text{NonAPSTAMacAddress,} \\
\text{ESSIdentifier,} \\
\text{EssLinkParameterSet)}
\]
The ESSLinkParameterSet parameter is defined in Table 6-7. It may include any or all of the elements in Table 6-7.

### Table 6-7—ESS Link Parameter Set

<td>Real</td>
<td>N/A</td>
<td>The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function.</td>
</tr>
</tbody>
</table>
6.4.8.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

6.4.8.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

6.4.8.4 MSGCF-Set-ESS-Link-Parameters.confirm

6.4.8.4.1 Function

This primitive indicates whether network parameters were accepted.

6.4.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-Set-ESS-Link-Parameters.confirm(
    NonAPStaMacAddress, 
    ESSIDIdentifier, 
    EssLinkParameterSet,
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

<td>EssLinkParameterSet</td>
<td>As defined in Table 6-7</td>
<td>N/A</td>
<td>The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.</td>
</tr>
</tbody>
</table>

6.4.8.4.3 When generated

This primitive is generated in response to the MSGCF-Set-ESS-Link-Parameters.request primitive and is used to indicate whether the parameter set was accepted.
6.4.8.4.4 Effect of receipt

The SME is notified of the new parameter set.

6.4.8.5 MSGCF-Get-ESS-Link-Parameters.request

6.4.8.5.1 Function

This primitive retrieves the current network parameters for a specific network.

6.4.8.5.2 Semantics of the service primitive

The primitive parameter is as follows:

\[
\text{MSGCF-Get-ESS-Link-Parameters.request}(
\text{ESSIdentifier}
)\]

6.4.8.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

6.4.8.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-Get-ESS-Link-Parameters.confirm primitive.

6.4.8.6 MSGCF-Get-ESS-Link-Parameters.confirm

6.4.8.6.1 Function

This primitive reports the current network parameters.

6.4.8.6.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MSGCF-Get-ESS-Link-Parameters.confirm}(
\text{ESSIdentifier},
\text{EssLinkParameterSet},
)\]

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>

Copyright © 2012 IEEE. All rights reserved.
6.4.8.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-Get-ESS-Link-Parameters.request primitive.

6.4.8.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

6.4.9 Network events

6.4.9.1 MSGCF-ESS-Link-Threshold-Report.indication

6.4.9.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 6-5.

6.4.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Threshold-Report.indication(
    NonAPSTAMacAddress,  
    ESSIdentifier,       
    EssLinkParameterSet,  
    ThresholdCrossingDirectionSet
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting the threshold crossing.</td>
</tr>
<tr>
<td>ESSIdentifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>EssLinkParameterSet</td>
<td>As defined in Table 6-7</td>
<td>N/A</td>
<td>A list of EssLinkParameterSets and their current values that have crossed preset thresholds for alerts.</td>
</tr>
<tr>
<td>ThresholdCrossingDirectionSet</td>
<td>Set of ThresholdCrossing Directions, one for each value in the EssLinkParameterSet</td>
<td>UPWARD, DOWNWARD</td>
<td>Whether the parameter has crossed the threshold while rising or falling.</td>
</tr>
</tbody>
</table>

6.4.9.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

6.4.9.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.
6.4.10 Network command interface

6.4.10.1 MSGCF-ESS-Link-Command.request

6.4.10.1.1 Function

This primitive requests that a STA take action for a network.

6.4.10.1.2 Semantics of the service primitive

The primitive parameters are as follows:

\[
\text{MSGCF-ESS-Link-Command.request}(
\text{NonAPSTAMacAddress, ESSIdentifier, CommandType})
\]

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMacAddress</td>
<td>MacAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting the threshold crossing.</td>
</tr>
<tr>
<td>ESSIDerifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>CommandType</td>
<td>Enumerated</td>
<td>DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN</td>
<td>Type of command to perform on the link as described in the following subclauses.</td>
</tr>
</tbody>
</table>

6.4.10.1.3 When generated

This primitive is generated by a higher layer protocol.

6.4.10.1.4 Effect of receipt

The convergence function issues commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-DEAUTHENTICATE.request to disconnect from the network, and the SME refrains from reconnecting to that network.

When the POWER_DOWN command type is specified, the SME powers down the non-AP STA. Before doing so, it may choose to notify the AP.

When the POWER_UP command type is specified, the SME starts the non-AP STA.

When the LOW POWER command type is specified, the higher layer is requesting that the IEEE 802.11 interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.
When the SCAN command type is specified, the higher layer is requesting that the STA search for IEEE 802.11 networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks are made available in the dot1MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-Link-Detected.indication event.

6.4.11 MAC state SME SAP—mobility management

6.4.11.1 MSSME-ESS-Link-Down-Predicted.indication

6.4.11.1.1 Function

This primitive indicates that the SME is predicting a link failure.

6.4.11.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MSSME-ESS-Link-Going-Down.indication(
    NonAPSTAMacAddress,
    ESSIDIdentifier,
    TimeInterval,
    ReasonCode
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NonAPSTAMac Address</td>
<td>MacAddress</td>
<td>Any valid individual MAC Address</td>
<td>The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is expected to go down.</td>
</tr>
<tr>
<td>ESSIDIdentifier</td>
<td>String</td>
<td>N/A</td>
<td>An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.</td>
</tr>
<tr>
<td>TimeInterval</td>
<td>Integer</td>
<td>N/A</td>
<td>Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval.</td>
</tr>
<tr>
<td>Reason Code</td>
<td>Enumerated</td>
<td>EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC</td>
<td>Indicates the reason the link is expected to go down.</td>
</tr>
</tbody>
</table>

6.4.11.1.3 When generated

This notification is generated by the SME when the IEEE 802.11 network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

6.4.11.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-Link-Down.indication event due to link parameter degradation.
6.5 PLME SAP interface

6.5.1 General

The PHY management service interface consists of the generic PLMEGET and PLMSEET primitives on PHY MIB attributes, as described previously, together with the PLME-RESET and PLME-CHARACTERISTICS primitives and the following specific primitives.

6.5.2 PLME-RESET.request

6.5.2.1 Function

This primitive is a request by the SME to reset the PHY. The PHY is always reset to the receive state to avoid accidental data transmission.

6.5.2.2 Semantics of the service primitive

This primitive has no parameters.

6.5.2.3 When generated

This primitive is generated at any time to reset the PHY.

6.5.2.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

6.5.3 PLME-CHARACTERISTICS.request

6.5.3.1 Function

This primitive is a request by the SME to provide the PHY operational characteristics.

6.5.3.2 Semantics of the service primitive

This primitive has no parameters.

6.5.3.3 When generated

This primitive is generated by the SME, at initialization time, to request the PHY entity to provide its operational characteristics.

6.5.3.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is the generation of a PLME-CHARACTERISTICS.confirm primitive that conveys its operational characteristics.

6.5.4 PLME-CHARACTERISTICS.confirm

6.5.4.1 Function

This primitive provides the PHY operational parameters.
6.5.4.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PLME-CHARACTERISTICS.confirm(
    aSlotTime,
    aSIFSTime,
    aSignalExtension,
    aCCATime,
    aPHY-RX-START-Delay,
    aRxTxTurnaroundTime,
    aTxPLCPDelay,
    aRxPLCPDelay,
    aRxTxSwitchTime,
    aTxRampOnTime,
    aTxRampOffTime,
    aTxRFDelay,
    aRxRFDelay,
    aAirPropagationTime,
    aMACProcessingDelay,
    aPreambleLength,
    aRIFSTime,
    aSymbolLength,
    aSTFOneLength,
    aSTFTwoLength,
    aLTFOneLength,
    aLTFTwoLength,
    aPLCPHeaderLength,
    aPLCPSigTwoLength,
    aPLCPServiceLength,
    aPLCPConvolutionalTailLength,
    aMPDUDurationFactor,
    aMPDUMaxLength,
    aPSDUMaxLength,
    aPPDUMaxTime,
    aIUSTime,
    aDTT2UTTTime,
    aCWmin,
    aCWmax,
    aMaxCSIMatricesReportDelay
    aMaxTODError,
    aMaxTOAError,
    aTxPmdTxStartRFDelay,
    aTxPmdTxStartRMS
)
```

The values assigned to the parameters is as specified in the PLME SAP interface specification contained within each PHY subclass of this standard. The parameter aMPDUDurationFactor is not used by all PHYs defined within this standard. The parameters aSignalExtension, aRIFSTime, aSymbolLength, aSTFOneLength, aSTFTwoLength, aLTFOneLength, aLTFTwoLength, aPLCPSigTwoLength, aPLCPServiceLength, aPLCPConvolutionalTailLength, aMPDUDurationFactor, aMPDUMaxLength, aPSDUMaxLength, aPPDUMaxTime, aIUSTime, aDTT2UTTTime, aCWmin, aCWmax, aMaxCSIMatricesReportDelay, aMaxTODError, aMaxTOAError, aTxPmdTxStartRFDelay, and aTxPmdTxStartRMS are not used by all PHYs defined within this standard.
<table>

<td>integer</td>
<td>The maximum number of octets in a PSDU that can be conveyed by a PPDU.</td>
</tr>
<tr>
<td>aPPDUMaxTime</td>
<td>integer</td>
<td>The maximum duration of a PPDU in milliseconds.</td>
</tr>
<tr>
<td>aIUSTime</td>
<td>integer</td>
<td>The minimum time between the end of a PSMP-UTT and the start of the following PSMP-UTT in the same PSMP sequence.</td>
</tr>
<tr>
<td>aDTT2UTTTime</td>
<td>integer</td>
<td>The minimum time between the end of a PSMP-DTT and the start of the PSMP-UTT addressed to the same STA.</td>
</tr>
<tr>
<td>aCWmin</td>
<td>integer</td>
<td>The minimum size of the CW, in units of aSlotTime.</td>
</tr>
<tr>
<td>aCWmax</td>
<td>integer</td>
<td>The maximum size of the CW, in units of aSlotTime.</td>
</tr>
<tr>
<td>aMaxCSIIMatriesReportDelay</td>
<td>integer</td>
<td>The maximum time (in milliseconds) between the reception of a frame containing a CSI Feedback Request or an NDP announcement and the transmission of the first CSI frame containing channel state information measured from the received Sounding Complete frame. See 9.29.2.4.4.</td>
</tr>
<tr>
<td>aMaxTODError</td>
<td>integer</td>
<td>An estimate of the maximum error (in 10 ns units) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm(TXSTATUS) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.</td>
</tr>
</tbody>
</table>
6.5.4.3 When generated

This primitive is issued by the PHY entity in response to a PLME-CHARACTERISTICS.request primitive.

6.5.4.4 Effect of receipt

The receipt of this primitive provides the operational characteristics of the PHY entity.

6.5.5 PLME-DSSSTESTMODE.request

6.5.5.1 Function

This primitive requests that the DSSS PHY entity enter a test mode operation. The parameters associated with this primitive are considered as recommendations and are optional in any particular implementation.

6.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```c
PLME-DSSSTESTMODE.request(  
    TEST_ENABLE,  
    TEST_MODE,  
    SCRAMBLE_STATE,  
    SPREADING_STATE,  
    DATA_TYPE,  
    DATA_RATE;  
    PREAMBLE_TYPE;  
    MODULATION_CODE_TYPE;  
)
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aMaxTOAError</td>
<td>Integer</td>
<td></td>
<td>An estimate of the maximum error (in 10 ns units) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indicate(RXVECTOR) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.</td>
</tr>
<tr>
<td>aTxPmdTxStartRFDelay</td>
<td>Integer</td>
<td></td>
<td>The delay (in units of 0.5 ns) between PMD_TXSTART.request being issued and the first frame energy sent by the transmitting port, for the current channel.</td>
</tr>
<tr>
<td>aTxPmdTxStartRMS</td>
<td>Integer</td>
<td></td>
<td>The RMS time of departure error (in units of 0.5 ns), where the time of departure error equals the difference between TIME_OF_DEPARTURE and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity’s clock.</td>
</tr>
</tbody>
</table>
The rate for DATA_Rate=05 is rounded up to the next higher 0.5 Mb/s value.

### 6.5.5.3 When generated

This primitive is generated at any time to enter the DSSS PHY test mode.

### 6.5.5.4 Effect of receipt

Receipt of this primitive by the PHY causes the DSSS PHY entity to enter the test mode of operation.

### 6.5.6 PLME-DSSSTESTOUTPUT.request

#### 6.5.6.1 Function

This optional primitive is a request by the SME to enable selected test signals from the PHY. The parameters associated with this primitive are considered as recommendations and are optional in any particular implementation.

#### 6.5.6.2 Semantics of the service primitive

The primitive parameter is as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPREADING_STATE</td>
<td>Boolean</td>
<td>true, false</td>
<td>If true, selects the operational state of the chipping.</td>
</tr>
<tr>
<td>DATA_TYPE</td>
<td>integer</td>
<td>1, 2, 3</td>
<td>Selects one of three data patterns to be used for the transmit portions of the tests, e.g., all ones, all zeros, and random data patterns.</td>
</tr>
<tr>
<td>DATA_RATE</td>
<td>integer</td>
<td>2, 3, 4, 5, 6, 9, 11, 12, 18, 22, 24, 27, 36, 44, 48, 54, 66, 72, 96, 108</td>
<td>Selects among rates: 02 = 1 Mb/s, 03 = 1.5 Mb/s, 04 = 2 Mb/s, 05 = 2.5 Mb/s, 06 = 3 Mb/s, 09 = 4.5 Mb/s, 11 = 5.5 Mb/s, 12 = 6 Mb/s, 18 = 9 Mb/s, 22 = 11 Mb/s, 24 = 12 Mb/s, 27 = 13.5 Mb/s, 36 = 18 Mb/s, 44 = 22 Mb/s, 48 = 24 Mb/s, 54 = 27 Mb/s, 66 = 33 Mb/s, 72 = 36 Mb/s, 96 = 48 Mb/s, 108 = 54 Mb/s</td>
</tr>
<tr>
<td>PREAMBLE_TYPE</td>
<td>Boolean</td>
<td>null, 0, 1</td>
<td>Selects the preamble length: 0 = long, 1 = short. Can be null.</td>
</tr>
<tr>
<td>MODULATION_CODE_TYPE</td>
<td>Integer</td>
<td>null, 0, 1, 2</td>
<td>Selects among modulation options: 0 = no optional modulation modes, 1 = optional ERP-PBCC modes, 2 = optional DSSS-OFDM modes. Can be null.</td>
</tr>
</tbody>
</table>
PLME-DSSSTESTOUTPUT.request(
  TEST_OUTPUT
)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Valid range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEST_OUTPUT</td>
<td>Boolean</td>
<td>true, false</td>
<td>If true, enables the selected test signals for testing DS PHY.</td>
</tr>
</tbody>
</table>

TEST_OUTPUT enables and disables selected signals for debugging and testing the PHY. Some signals that can be available for output are the PHY-TXSTART.request, PHY-RXSTART.indication(RXVECTOR), and PHY-CCA.indication primitives, the chipping clock, the data clock, the symbol clock, transmit (TX) data, and receive (RX) data.

### 6.5.6.3 When generated

This primitive is generated at any time to enable the test outputs when in the DSSS PHY test mode.

### 6.5.6.4 Effect of receipt

Receipt of this primitive by the DSSS PHY causes the DSSS PHY entity to enable the test outputs using the modes set by the most recent PLME-DSSSTESTMODE.request primitive.

### 6.5.7 PLME-TXTIME.request

#### 6.5.7.1 Function

This primitive is a request for the PHY to calculate the time required to transmit onto the WM a PPDU containing a specified length PSDU, and using a specified format, data rate, and signalling.

#### 6.5.7.2 Semantics of the service primitive

This primitive provides the following parameter:

```cpp
PLME-TXTIME.request(
  TXVECTOR
)
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU, as further described in 7.3.4.5, 18.4 and 20.4 (which defines the local PHY entity).

#### 6.5.7.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to determine the time required to transmit a particular PSDU.

#### 6.5.7.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to generate a PHY-TXTIME.confirm primitive that conveys the required transmission time.
6.5.8 PLME-TXTIME.confirm

6.5.8.1 Function

This primitive indicates the time required to transmit the PPDU described in the corresponding PLME-TXTIME.request.

6.5.8.2 Semantics of the service primitive

This primitive provides the following parameter:

\[
\text{PLME-TXTIME.confirm}(\text{TXTIME})
\]

The TXTIME represents the time, in microseconds, required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive. If the calculated time includes a fractional microsecond, the TXTIME value is rounded up to the next higher integer.

6.5.8.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-TXTIME.request primitive.

6.5.8.4 Effect of receipt

The receipt of this primitive provides the MAC sublayer with the PPDU transmission time.
7. PHY service specification

7.1 Scope

The PHY services provided to the IEEE 802.11 WLAN MAC are described in this clause. Different PHYs are defined as part of this standard. Each PHY can consist of two protocol functions as follows:

a) A PHY convergence function, which adapts the capabilities of the PMD system to the PHY service. This function is supported by the PLCP, which defines a method of mapping the IEEE 802.11 MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs using the associated PMD system.

b) A PMD system, whose function defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs.

Each PMD sublayer may require the definition of a unique PLCP. If the PMD sublayer already provides the defined PHY services, the PHY convergence function might be null.

7.2 PHY functions

The protocol reference model for the IEEE 802.11 architecture is shown in Figure 4-14 (in 4.9). Most PHY definitions contain three functional entities: the PMD function, the PHY convergence function, and the layer management function.

The PHY service is provided to the MAC entity at the STA through a SAP, called the PHY-SAP, as shown in Figure 4-14. A set of primitives might also be defined to describe the interface between the PLCP sublayer and the PMD sublayer, called the PMD_SAP.

7.3 Detailed PHY service specifications

7.3.1 Scope and field of application

The services provided by the PHY to the IEEE 802.11 MAC are specified in this subclause. These services are described in an abstract way and do not imply any particular implementation or exposed interface.

7.3.2 Overview of the service

The PHY function as shown in Figure 4-14 is separated into two sublayers: the PLCP sublayer and the PMD sublayer. The function of the PLCP sublayer is to provide a mechanism for transferring MPDUs between two or more STAs over the PMD sublayer.

7.3.3 Overview of interactions

The primitives associated with communication between the IEEE 802.11 MAC sublayer and the IEEE 802.11 PHY fall into two basic categories:

a) Service primitives that support MAC peer-to-peer interactions;

b) Service primitives that have local significance and support sublayer-to-sublayer interactions.

7.3.4 Basic service and options

7.3.4.1 General

All of the service primitives described here are considered mandatory unless otherwise specified.
7.3.4.2 PHY-SAP peer-to-peer service primitives

Table 7-1 indicates the primitives for peer-to-peer interactions.

<table>
<thead>
<tr>
<th>Primitive</th>
<th>Request</th>
<th>Indicate</th>
<th>Confirm</th>

7.3.4.4 PHY-SAP service primitives parameters

Table 7-3 shows the parameters used by one or more of the PHY-SAP service primitives.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Associated primitive</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA</td>
<td>PHY-DATA.request, PHY-DATA.indication</td>
<td>Octet value X'00'–X'FF'</td>
</tr>
<tr>
<td>TXVECTOR</td>
<td>PHY-TXSTART.request</td>
<td>A set of parameters</td>
</tr>
<tr>
<td>STATUS</td>
<td>PHY-CCA.indication</td>
<td>(BUSY, [channel-list]) (IDLE)</td>
</tr>
<tr>
<td>RXVECTOR</td>
<td>PHY-RXSTART.indication, PHY-RXEND.indication</td>
<td>A set of parameters</td>
</tr>
<tr>
<td>RXERROR</td>
<td>PHY-RXEND.indication</td>
<td>NoError, FormatViolation, CarrierLost, UnsupportedRate</td>
</tr>
</tbody>
</table>
Several service primitives include a parameter vector. This vector is a list of parameters that may vary depending on the PHY type. Table 7-4 lists the minimum parameter values required by the MAC or PHY in each of the parameter vectors. Parameters in the vectors that are management rather than MAC may be specific to the PHY and are listed in the clause covering that PHY.

**Table 7-4—Vector descriptions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Associated vector</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATARATE</td>
<td>TXVECTOR, RXVECTOR</td>
<td>PHY dependent. The name of the field used to specify the Tx data rate and report the Rx data rate may vary for different PHYs.</td>
</tr>
<tr>
<td>LENGTH</td>
<td>TXVECTOR, RXVECTOR</td>
<td>PHY dependent</td>
</tr>
<tr>
<td>ACTIVE_RXCHAIN_SET</td>
<td>PHYCONFIG_VECTOR</td>
<td>The ACTIVE_RXCHAIN_SET parameter indicates which receive chains of the available receive chains are active. The length of the field is 8 bits. A 1 in bit position ( n ) indicates that the receive chain numbered ( n ) is used. At most 4 bits out of 8 may be set to 1.</td>
</tr>
<tr>
<td>OPERATING_CHANNEL</td>
<td>PHYCONFIG_VECTOR</td>
<td>The operating channel the PHY is configured use.</td>
</tr>
<tr>
<td>CHANNEL_OFFSET</td>
<td>PHYCONFIG_VECTOR</td>
<td>Enumerated type: CH_OFFSET_NONE indicates operation in 20 MHz HT STAs. CH_OFFSET_ABOVE indicates operation in 40 MHz with the secondary channel above the primary. CH_OFFSET_BELOW indicates operation in 40 MHz with the secondary channel below the primary.</td>
</tr>
</tbody>
</table>

The Clause 20 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 20 PHY modes of operation as described in 20.2. In certain modes of operation, the DATARATE parameter is replaced by a MCS value. The mapping from Clause 20 MCS to data rate is defined in 20.6.
7.3.5 PHY-SAP detailed service specification

7.3.5.1 Introduction
Subclause 7.3.5 describes the services provided by each PHY primitive.

7.3.5.2 PHY-DATA.request

7.3.5.2.1 Function
This primitive defines the transfer of an octet of data from the MAC sublayer to the local PHY entity.

7.3.5.2.2 Semantics of the service primitive
The primitive provides the following parameter:

\[
\text{PHY-DATA.request(} \quad \text{DATA} \quad \text{)}
\]

The DATA parameter is an octet of value X'00' to X'FF'.

7.3.5.2.3 When generated
This primitive is generated by the MAC sublayer to transfer an octet of data to the PHY entity. This primitive can only be issued following a transmit initialization response (a PHY-TXSTART.confirm primitive) from the PHY.

7.3.5.2.4 Effect of receipt
The receipt of this primitive by the PHY entity causes the PLCP transmit state machine to transmit an octet of data. When the PHY entity receives the octet, it issues a PHY-DATA.confirm primitive to the MAC sublayer.

7.3.5.3 PHY-DATA.indication

7.3.5.3.1 Function
This primitive indicates the transfer of data from the PHY to the local MAC entity.

7.3.5.3.2 Semantics of the service primitive
The primitive provides the following parameter:

\[
\text{PHY-DATA.indication(} \quad \text{DATA} \quad \text{)}
\]

The DATA parameter is an octet of value X'00' to X'FF'.

7.3.5.3.3 When generated
The PHY-DATA.indication primitive is generated by a receiving PHY entity to transfer the received octet of data to the local MAC entity. The time between receipt of the last bit of the provided octet from the WM and the receipt of this primitive by the MAC entity is the sum of aRXRFDelay + aRxPLCPDelay.
7.3.5.3.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.4 PHY-DATA.confirm

7.3.5.4.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the transfer of data from the MAC entity to the PHY.

7.3.5.4.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-DATA.confirm

This primitive has no parameters.

7.3.5.4.3 When generated

This primitive is issued by the PHY to the MAC entity when the PLCP has completed the transfer of data from the MAC entity to the PHY. The PHY issues this primitive in response to every PHY-DATA.request primitive issued by the MAC sublayer.

7.3.5.4.4 Effect of receipt

The receipt of this primitive by the MAC causes the MAC to start the next MAC entity request.

7.3.5.5 PHY-TXSTART.request

7.3.5.5.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to start the transmission of a PSDU.

7.3.5.5.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-TXSTART.request( TXVECTOR )

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. This vector contains both PLCP and PHY management parameters. The minimum required PHY parameters are listed in 7.3.4.5.

7.3.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to begin the transmission of a PSDU.

7.3.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to start the local transmit state machine.
The behavior expected by the MAC pursuant to the issuance of PHY-TXSTART.request primitive is shown in Figure 9-14 (in 9.3.7).

### 7.3.5.6 PHY-TXSTART.confirm

#### 7.3.5.6.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the start of a transmission and to indicate parameters related to the start of the transmission. The PHY issues this primitive in response to every PHY-TXSTART.request primitive issued by the MAC sublayer.

#### 7.3.5.6.2 Semantics of the service primitive

The semantics of the primitive are as follows:

$$\text{PHY-TXSTART.confirm} \left( \text{TXSTATUS} \right)$$

The TXSTATUS represents a list of parameters that the local PHY entity provides to the MAC sublayer related to the transmission of an MPDU. This vector contains both PLCP and PHY operational parameters. The required PHY parameters are listed in 7.3.4.4.

#### 7.3.5.6.3 When generated

This primitive is issued by the PHY to the MAC entity once all of the following conditions are met:

- The PHY has received a PHY-TXSTART.request primitive from the MAC entity.
- The PLCP has issued PMD.TX.STATUS.request primitive if dot11MgmtOptionTODActivated is true and the TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED in the PHY-TXSTART.request(TXVECTOR) primitive is true.
- The PHY is ready to begin accepting outgoing data octets from the MAC.

#### 7.3.5.6.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets. Parameters in the TXSTATUS vector may be included in transmitted frames so that recipients on multiple channels can compensate for differences in the transmit time of the frames, and so to determine the time differences of air propagation times between transmitter and pairs of recipients and hence to compute the location of the transmitter via multilateration. See Annex T. In addition, the TXSTATUS vector may include the TX_START_OF_FRAME_OFFSET.

### 7.3.5.7 PHY-TXEND.request

#### 7.3.5.7.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity that the current transmission of the PSDU be completed.

#### 7.3.5.7.2 Semantics of the service primitive

The semantics of the primitive are as follows:

$$\text{PHY-TXEND.request}$$

This primitive has no parameters.
7.3.5.7.3 When generated

This primitive is generated when the MAC sublayer has received the last PHY-DATA.confirm primitive from the local PHY entity for the PSDU currently being transferred.

7.3.5.7.4 Effect of receipt

The effect of receipt of this primitive by the local PHY entity is to stop the transmit state machine.

7.3.5.8 PHY-TXEND.confirm

7.3.5.8.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the completion of a transmission. The PHY issues this primitive in response to every PHY-TXEND.request primitive issued by the MAC sublayer.

7.3.5.8.2 Semantics of the service primitive

The semantics of the primitive are as follows:

- PHY-TXEND.confirm

This primitive has no parameters.

7.3.5.8.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-TXEND.request primitive immediately after transmitting the end of the last bit of the last data octet indicating that the symbol containing the last data octet has been transferred and any Signal Extension has expired.

7.3.5.8.4 Effect of receipt

The receipt of this primitive by the MAC entity provides the time reference for the contention backoff protocol.

7.3.5.9 PHY-CCARESET.request

7.3.5.9.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to reset the CCA state machine and to turn IPI reporting on and off by means of the IPI-STATE parameter.

7.3.5.9.2 Semantics of the service primitive

The primitive provides the following parameter:

- PHY-CCARESET.request(IPI-STATE)

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The parameter value is IPI-ON when the MAC sublayer is requesting the PHY entity to report IPI values when the PHY is neither receiving nor transmitting an MPDU. IPI-ON turns on IPI reporting in the PHY entity. IPI-OFF turns off IPI reporting in the PHY entity.
7.3.5.9.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity at the end of a NAV timer. This request can be used by some PHY implementations that may synchronize antenna diversity with slot timings.

7.3.5.9.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to reset the PLCP CS/CCA timers to the state appropriate for the end of a received frame. If IPI-STATE parameter is IPI-ON, the PHY entity collects IPI values when it is not transmitting or receiving and provides those values to the MAC sublayer using the IPI-REPORT parameter.

7.3.5.10 PHY-CCARESET.confirm

7.3.5.10.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has reset the CCA state machine and to provide observed IPI values when IPI reporting is turned on.

7.3.5.10.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCARESET.confirm(
    IPI-STATE,  
    IPI-REPORT
)
```

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The IPI-STATE value shall be set to the value of IPI-STATE received by the PHY entity in the most recent PHY-CCARESET.request primitive.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY_CCA.indication primitive, whichever occurred latest.

7.3.5.10.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-CCA-RESET.request primitive.

7.3.5.10.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.11 PHY-CCA.indication

7.3.5.11.1 Function

This primitive is an indication by the PHY to the local MAC entity of the current state of the medium and to provide observed IPI values when IPI reporting is turned on.
7.3.5.11.2 Semantics of the service primitive

The primitive provides the following parameters:

\[
\text{PHY-CCA.indication(}
\text{STATE,}
\text{IPI-REPORT,}
\text{channel-list}
\text{)}
\]

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel(s) by the PHY determines that the channel(s) are not available. Otherwise, the value of the parameter is IDLE.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting has been turned on by the IPI-STATE parameter. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values may be used by the MAC sublayer for Radio Measurement purposes. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY_CCA.indication primitive, whichever occurred latest.

When STATE is IDLE or when, for the type of PHY in operation, CCA is determined by a single channel, the channel-list parameter is absent. Otherwise, it carries a set indicating which channels are busy, represented by the values \{primary\}, \{primary, secondary\}, and \{secondary\}.

7.3.5.11.3 When generated

This primitive is generated within aCCATime of the occurrence of a change in the status of the channel(s) from channel idle to channel busy or from channel busy to channel idle. This includes the period of time when the PHY is receiving data. Refer to specific PHY clauses for details about CCA behavior for a given PHY.

If the STA is an HT STA and the operating channel width is 20 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF

If the STA is an HT STA and the operating channel width is 40 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT and the PPDU is received in the primary channel
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF provided that the PPDU is either a 20 MHz PPDU received in the primary channel or a 40 MHz PPDU

7.3.5.11.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.12 PHY-RXSTART.indication

7.3.5.12.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PLCP has received a valid start of a PPDU, including a valid PLCP header.
7.3.5.12.2 Semantics of the service primitive

The primitive provides the following parameter:

\[
\text{PHY-RXSTART.indication(}
\quad \text{RXVECTOR}
\quad \text{)}
\]

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PLCP header or upon receipt of the last PSDU data bit in the received frame. The required parameters are listed in 7.3.4.5.

7.3.5.12.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated the PLCP header at the start of a new PPDU.

After generating a PHYRXSTART.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication(IDLE) primitive) during the period required by that PHY to transfer a frame of the indicated LENGTH at the indicated DATARATE. This physical medium busy condition should be maintained even if a PHY-RXEND.indication(CarrierLost) or a PHYRXEND.indication(Format-Violation) primitive is generated by the PHY prior to the end of this period.

7.3.5.12.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.13 PHY-RXEND.indication

7.3.5.13.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PSDU currently being received is complete.

7.3.5.13.2 Semantics of the service primitive

The primitive provides the following parameters:

\[
\text{PHY-RXEND.indication(}
\quad \text{RXERROR,}
\quad \text{RXVECTOR}
\quad \text{)}
\]

The RXERROR parameter can convey one or more of the following values: NoError, FormatViolation, CarrierLost, or UnsupportedRate. A number of error conditions may occur after the PLCP’s receive state machine has detected what appears to be a valid preamble and SFD. The following describes the parameter returned for each of those error conditions.

- **NoError.** This value is used to indicate that no error occurred during the receive process in the PLCP.
- **FormatViolation.** This value is used to indicate that the format of the received PPDU was in error.
- **CarrierLost.** This value is used to indicate that during the reception of the incoming PSDU, the carrier was lost and no further processing of the PSDU can be accomplished.
- **UnsupportedRate.** This value is used to indicate that during the reception of the incoming PPDU, a nonsupported date rate was detected.
The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PLCP header or upon receipt of the last PSDU data bit in the received frame. RXVECTOR is an included parameter only when dot11RadioMeasurementActivated is true. This vector may contain both MAC and MAC management parameters. The required parameters are listed in 7.3.4.5.

**7.3.5.13.3 When generated**

This primitive is generated by the PHY for the local MAC entity to indicate that the receive state machine has completed a reception with or without errors. When a Signal Extension is present, the primitive is generated at the end of the Signal Extension.

In the case of an RXERROR value of NoError, the MAC uses the PHY-RXEND.indication primitive as reference for channel access timing, as shown in Figure 9-14 (in 9.3.7).

**7.3.5.13.4 Effect of receipt**

The effect of receipt of this primitive is for the MAC to begin inter-frame space processing, as described in 9.3.7.

**7.3.5.14 PHY-CONFIG.request**

**7.3.5.14.1 Function**

This primitive is a request by the MAC sublayer to the local PHY entity to configure the PHY.

**7.3.5.14.2 Semantics of the service primitive**

The primitive provides the following parameter:

```
PHY-CONFIG.request( PHYCONFIG_VECTOR )
```

**7.3.5.14.3 When generated**

This primitive is generated by the MAC sublayer for the local PHY entity when it desires to change the configuration of the PHY.

**7.3.5.14.4 Effect of receipt**

The effect of receipt of this primitive by the PHY is to apply the parameters provided with the primitive and to configure the PHY for future operation.

**7.3.5.15 PHY-CONFIG.confirm**

**7.3.5.15.1 Function**

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has applied the parameters provided in the PHY-CONFIG.request primitive.

**7.3.5.15.2 Semantics of the service primitive**

The semantics of the primitive are as follows:

```
PHY-CONFIG.confirm
```
This primitive has no parameters.

### 7.3.5.15.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received and successfully applied the parameters in the PHY-CONFIG.request primitive.

### 7.3.5.15.4 Effect of receipt

The effect of the receipt of this primitive by the MAC is unspecified.

### 7.4 PHY management

The MIB comprises the managed objects, attributes, actions, and notifications required to manage a STA. The definition of these managed objects, attributes, actions, and notifications, as well as their structure, is presented in Annex C.
8. Frame formats

8.1 General requirements

The format of the MAC frames is specified in this clause. A STA shall be able properly to construct a subset of the frames specified in this clause for transmission and to decode a (potentially different) subset of the frames specified in this clause upon validation following reception. The particular subset of these frames that a STA constructs and decodes is determined by the functions supported by that particular STA. All STAs shall be able to validate every received frame using the frame check sequence (FCS) and to interpret certain fields from the MAC headers of all frames.

A compliant STA shall transmit frames using only the frame formats described in Clause 8.

8.2 MAC frame formats

8.2.1 Basic components

Each frame consists of the following basic components:

a) A MAC header, which comprises frame control, duration, address, optional sequence control information, optional QoS Control information (QoS data frames only), and optional HT Control fields (+HTC frames only);

b) A variable-length frame body, which contains information specific to the frame type and subtype;

c) A FCS, which contains an IEEE 32-bit CRC.

8.2.2 Conventions

Structures defined in the MAC sublayer are described as a sequence of fields in specific order. Each figure in Clause 8 depicts the fields/subfields as they appear in the MAC frame and in the order in which they are passed to the physical layer convergence procedure (PLCP), from left to right.

In figures, all bits within fields are numbered, from 0 to \( k \), where the length of the field is \( k + 1 \) bits. Bits within numeric fields that are longer than a single bit are depicted in increasing order of significance, i.e., with the lowest numbered bit having the least significance. The octet boundaries within a field can be obtained by taking the bit numbers of the field modulo 8. Octets within numeric fields that are longer than a single octet are depicted in increasing order of significance, from lowest numbered bit to highest numbered bit. The octets in fields longer than a single octet are sent to the PLCP in order from the octet containing the lowest numbered bits to the octet containing the highest numbered bits.

Any field containing a CRC is an exception to this convention and is transmitted commencing with the coefficient of the highest-order term.

MAC addresses are assigned as ordered sequences of bits. The Individual/Group bit is always transferred first and is bit 0 of the first octet.

Organizationally unique identifiers (OUIs) and Organization Identifiers are specified in two forms: an ordered sequence of octets, and a numeric form. Treating the OUI or Organization Identifier as an ordered sequence of octets, the leftmost octet is always transferred first. This is equivalent to transmitting the most significant octet of the numeric form first.

Values specified in decimal are coded in natural binary unless otherwise stated. The values in Table 8-1 are in binary, with the bit assignments shown in the table. Values in other tables are shown in decimal notation.
Reception, in references to frames or fields within frames (e.g., received Beacon frames or a received Duration/ID field), applies to MPDUs or MAC management protocol data units (MMPDUs) indicated from the PHY layer without error and validated by FCS within the MAC sublayer. Without further qualification, reception by the MAC sublayer implies that the frame contents are valid, and that the protocol version is supported (see 8.2.4.1.2), with no implication regarding frame addressing or regarding whether the frame type or other fields in the MAC header are meaningful to the MAC entity that has received the frame.

A frame that contains the HT Control field, including the Control Wrapper frame, is referred to as a +HTC frame.

A QoS Data frame that is transmitted by a mesh STA is referred to as a Mesh Data frame.

Parentheses enclosing portions of names or acronyms are used to designate a set of related names that vary based on the inclusion of the parenthesized portion. For example,

- **QoS +CF-Poll frame** refers to the three QoS data subtypes that include “+CF-Poll”: the QoS Data+CF-Poll frame, subtype 1010; QoS Data+CF-Ack+CF-Poll frame, subtype 1011; and QoS CF-Ack+CF-Poll frame, subtype 1111.

- **QoS CF-Poll frame** refers specifically to the QoS CF-Poll frame, subtype 1110.

- **QoS (+)CF-Poll frame** refers to all four QoS data subtypes with CF-Poll: the QoS CF-Poll frame, subtype 1110; the QoS CF-Ack+CF-Poll frame, subtype 1111; the QoS Data+CF-Poll frame, subtype 1010; and the QoS Data+CF-Ack+CF-Poll frame, subtype 1011.

- **QoS (+)Null frame** refers to all three QoS data subtypes with “no data”: the QoS Null (no data) frame, subtype 1100; the QoS CF-Poll (no data) frame, subtype 1110; and the QoS CF-Ack+CF-Poll frame, subtype 1111.

- **QoS +CF-Ack frame** refers to the three QoS data subtypes that include “+CF-Ack”: the QoS Data+CF-Ack frame, subtype 1001; QoS Data+CF-Ack+CF-Poll frame, subtype 1011; and QoS CF-Ack+CF-Poll frame, subtype 1111.

- Whereas (QoS) **CF-Poll frame** refers to the QoS CF-Poll frame, subtype 1110, and the CF-Poll frame, subtype 0110.

Reserved fields and subfields are set to 0 upon transmission and are ignored upon reception.

### 8.2.3 General frame format

The MAC frame format comprises a set of fields that occur in a fixed order in all frames. Figure 8-1 depicts the general MAC frame format. The first three fields (Frame Control, Duration/ID, and Address 1) and the last field (FCS) in Figure 8-1 constitute the minimal frame format and are present in all frames, including reserved types and subtypes. The fields Address 2, Address 3, Sequence Control, Address 4, QoS Control, HT Control, and Frame Body are present only in certain frame types and subtypes. Each field is defined in 8.2.4. The format of each of the individual subtypes of each frame type is defined in 8.3. The components of management frame bodies are defined in 8.4. The formats of management frames of subtype Action are defined in 8.5.

</tbody>
</table>

**Figure 8-1—MAC frame format**
The Frame Body field is of variable size. The maximum frame body size is determined by the maximum MSDU size (2304 octets), plus the length of the Mesh Control field (6, 12, or 18 octets) if present, the maximum unencrypted MMPDU size excluding the MAC header and FCS (2304 octets) or the maximum A-MSDU size (3839 or 7935 octets, depending upon the STA’s capability), plus any overhead from security encapsulation.

8.2.4 Frame fields

8.2.4.1 Frame Control field

8.2.4.1.1 General

The Frame Control field consists of the following subfields: Protocol Version, Type, Subtype, To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and Order. The format of the Frame Control field is illustrated in Figure 8-2.

![Figure 8-2—Frame Control field](image)

8.2.4.1.2 Protocol Version field

The Protocol Version field is 2 bits in length and is invariant in size and placement across all revisions of this standard. For this standard, the value of the protocol version is 0. All other values are reserved. The revision level will be incremented only when a fundamental incompatibility exists between a new revision and the prior edition of the standard. See 9.24.2.

8.2.4.1.3 Type and Subtype fields

The Type field is 2 bits in length, and the Subtype field is 4 bits in length. The Type and Subtype fields together identify the function of the frame. There are three frame types: control, data, and management. Each of the frame types has several defined subtypes. In data frames, the most significant bit (MSB) of the Subtype field, b7, is defined as the QoS subfield. Table 8-1 defines the valid combinations of type and subtype. (The numeric values in Table 8-1 are shown in binary.)

</tbody>
</table>
Each Subtype field bit position is used to indicate a specific modification of the basic data frame (subtype 0). Frame Control bit 4 is set to 1 in data subtypes that include +CF-Ack, bit 5 is set to 1 in data subtypes that include +CF-Poll, bit 6 is set to 1 in data subtypes that contain no Frame Body field, and bit 7 is set to 1 in the QoS data subtypes, which have QoS Control fields in their MAC headers.

8.2.4.1.4 To DS and From DS fields

The meaning of the combinations of values for the To DS and From DS fields are shown in Table 8-2.

<table>
<thead>
<tr>
<th>To DS and From DS values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>To DS = 0 From DS = 0</td>
<td>A data frame direct from one STA to another STA within the same IBSS, a data frame direct from one non-AP STA to another non-AP STA within the same BSS, or a data frame outside the context of a BSS, as well as all management and control frames.</td>
</tr>
<tr>
<td>To DS = 1 From DS = 0</td>
<td>A data frame destined for the DS or being sent by a STA associated with an AP to the Port Access Entity in that AP.</td>
</tr>
<tr>
<td>To DS = 0 From DS = 1</td>
<td>A data frame exiting the DS or being sent by the Port Access Entity in an AP, or a group addressed Mesh Data frame with Mesh Control field present using the three-address MAC header format.</td>
</tr>
<tr>
<td>To DS = 1 From DS = 1</td>
<td>A data frame using the four-address MAC header format. This standard defines procedures for using this combination of field values only in a mesh BSS.</td>
</tr>
</tbody>
</table>

8.2.4.1.5 More Fragments field

The More Fragments field is 1 bit in length and is set to 1 in all data or management type frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames.

8.2.4.1.6 Retry field

The Retry field is 1 bit in length and is set to 1 in any data or management type frame that is a retransmission of an earlier frame. It is set to 0 in all other frames. A receiving STA uses this indication to aid in the process of eliminating duplicate frames.

8.2.4.1.7 Power Management field

The Power Management field is 1 bit in length and is used to indicate the power management mode of a STA. The value of this field is either reserved (as defined below) or remains constant in each frame from a particular STA within a frame exchange sequence (see Annex G). The value indicates the mode of the STA after the successful completion of the frame exchange sequence.

In an infrastructure BSS, the following applies:

— The Power Management field is reserved in all management frames that are not bufferable management frames.
— The Power Management field is reserved in all management frames transmitted by a STA to an AP with which it is not associated.
— The Power Management field is reserved in all frames transmitted by the AP.
— Otherwise, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.
In an IBSS, the following applies:

— The Power Management field is reserved in all management frames that are not bufferable management frames and that are not individually addressed Probe Request frames.

— Otherwise, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.

In an MBSS, the following applies:

— A value of 0 in group addressed frames, in management frames transmitted to nonpeer STAs, and in Probe Response frames indicates that the mesh STA will be in active mode towards all neighbor mesh STAs. A value of 1 in group addressed frames, in management frames transmitted to nonpeer STAs, and in Probe Response frames indicates that the mesh STA will be in deep sleep mode towards all nonpeer mesh power STAs.

— A value of 0 in individually addressed frames transmitted to a peer mesh STA indicates that the mesh STA will be in active mode towards this peer mesh STA. A value of 1 in individually addressed frames transmitted to a peer mesh STA, except Probe Response frames, indicates that the mesh STA will be in either light sleep mode or deep sleep mode towards this peer mesh STA. When the QoS Control field is present in the frame, the Mesh Power Save Level subfield in the QoS Control field indicates whether the mesh STA will be in light sleep mode or in deep sleep mode for the recipient mesh STA as specified in 8.2.4.5.11.

The mesh power mode transition rules are described in 13.14.3.

8.2.4.1.8 More Data field

The More Data field is 1 bit in length and is used to indicate to a STA in PS mode that more BUs are buffered for that STA at the AP. The More Data field is valid in individually addressed data or management type frames transmitted by an AP to a STA in PS mode. A value of 1 indicates that at least one additional buffered BU is present for the same STA.

The More Data field is optionally set to 1 in individually addressed data type frames transmitted by a CF-Pollable STA to the PC in response to a CF-Poll to indicate that the STA has at least one additional buffered MSDU available for transmission in response to a subsequent CF-Poll.

For a STA in which the More Data Ack subfield of its QoS Capability element is 1 and that has APSD enabled, an AP optionally sets the More Data field to 1 in ACK frames to this STA to indicate that the AP has a pending transmission for the STA.

For a STA with TDLS peer PSM enabled and the More Data Ack subfield equal to 1 in the QoS Capability element of its transmitted TDLS Setup Request frame or TDLS Setup Response frame, a TDLS peer STA optionally sets the More Data field to 1 in ACK frames to this STA to indicate that it has a pending transmission for the STA.

The More Data field is 1 in individually addressed frames transmitted by a mesh STA to a peer mesh STA that is either in light sleep mode or in deep sleep mode for the corresponding mesh peering, when additional BUs remain to be transmitted to this peer mesh STA.

The More Data field is set to 0 in all other individually addressed frames.

The More Data field is set to 1 in group addressed frames transmitted by the AP when additional group addressed bufferable units (BUs) remain to be transmitted by the AP during this beacon interval. The More Data field is set to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval and in all group addressed frames transmitted by non-AP STAs.
The More Data field is 1 in group addressed frames transmitted by a mesh STA when additional group addressed BUs remain to be transmitted. The More Data field is 0 in group addressed frames transmitted by a mesh STA when no more group addressed BUs remain to be transmitted.

8.2.4.1.9 Protected Frame field

The Protected Frame field is 1 bit in length. The Protected Frame field is set to 1 if the Frame Body field contains information that has been processed by a cryptographic encapsulation algorithm. The Protected Frame field is set to 1 only within data frames and within management frames of subtype Authentication, and individually addressed robust management frames. The Protected Frame field is set to 0 in all other frames. When the Protected Frame field is equal to 1, the Frame Body field is protected utilizing the cryptographic encapsulation algorithm and expanded as defined in Clause 11. The Protected Frame field is set to 0 in Data frames of subtype Null Function, CF-ACK (no data), CF-Poll (no data), CF-ACK+CF-Poll (no data), QoS Null (no data), QoS CF-Poll (no data), and QoS CF-ACK+CF-Poll (no data) (see, for example, 11.4.2.2 and 11.4.3.1 that show that the frame body needs to be 1 octet or longer to apply the encapsulation).

8.2.4.1.10 Order field

The Order field is 1 bit in length. It is used for two purposes:
- It is set to 1 in a non-QoS data frame transmitted by a non-QoS STA to indicate that the frame contains an MSDU, or fragment thereof, that is being transferred using the StrictlyOrdered service class.
- It is set to 1 in a QoS data or management frame transmitted with a value of HT_GF or HT_MF for the FORMAT parameter of the TXVECTOR to indicate that the frame contains an HT Control field.

Otherwise, the Order field is set to 0.

8.2.4.2 Duration/ID field

The Duration/ID field is 16 bits in length. The contents of this field vary with frame type and subtype, with whether the frame is transmitted during the CFP, and with the QoS capabilities of the sending STA. The contents of the field are defined as follows:

a) In control frames of subtype PS-Poll, the Duration/ID field carries the association identifier (AID) of the STA that transmitted the frame in the 14 least significant bits (LSB), and the 2 most significant bits (MSB) both set to 1. The value of the AID is in the range 1–2007.
b) In frames transmitted by the PC and non-QoS STAs, during the CFP, the Duration/ID field is set to a fixed value of 32 768.
c) In all other frames sent by non-QoS STAs and control frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 8.3.
d) In data and management frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 8.2.5.

See 9.24.3 on the processing of this field in received frames.

The encoding of the Duration/ID field is given in Table 8-3.

The Duration/ID fields in the MAC headers of MPDUs in an A-MPDU all carry the same value.

NOTE—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.
8.2.4.3 Address fields

8.2.4.3.1 General

There are four address fields in the MAC frame format. These fields are used to indicate the basic service set identifier (BSSID), source address (SA), destination address (DA), transmitting STA address (TA), and receiving STA address (RA). Certain frames may not contain some of the address fields.

Certain address field usage is specified by the relative position of the address field (1–4) within the MAC header, independent of the type of address present in that field. For example, receiver address matching is always performed on the contents of the Address 1 field in received frames, and the receiver address of CTS and ACK frames is always obtained from the Address 2 field in the corresponding RTS frame, or from the frame being acknowledged.

8.2.4.3.2 Address representation

Each Address field contains a 48-bit address as defined in 9.2 of IEEE Std 802-2001.

8.2.4.3.3 Address designation

A MAC sublayer address is one of the following two types:

a) Individual address. The address assigned to a particular STA on the network.

b) Group address. A multidestination address, which may be in use by one or more STAs on a given network. The two kinds of group addresses are as follows:

1) Multicast-group address. An address associated by higher level convention with a group of logically related STAs.

2) Broadcast address. A distinguished, predefined group address that always denotes the set of all STAs on a given LAN. All ones are interpreted to be the broadcast address. This group is predefined for each communication medium to consist of all STAs actively connected to that medium; it is used to broadcast to all the active STAs on that medium.

The address space is also partitioned into locally administered and universal (globally administered) addresses. The nature of a body and the procedures by which it administers these universal (globally administered) addresses is beyond the scope of this standard. See IEEE Std 802-2001 for more information.

</table>
8.2.4.3.4 BSSID field

The BSSID field is a 48-bit field of the same format as an IEEE 802 MAC address. When dot11OCBActivated is false, the value of this field uniquely identifies each BSS. The value of this field, in an infrastructure BSS, is the MAC address currently in use by the STA in the AP of the BSS.

The value of this field in an IBSS is a locally administered IEEE MAC address formed from a 46-bit random number generated according to the procedure defined in 10.1.4. The individual/group bit of the address is set to 0. The universal/local bit of the address is set to 1. This mechanism is used to provide a high probability of selecting a unique BSSID.

The value of all 1s is used to indicate the wildcard BSSID. The wildcard value is not used in the BSSID field except where explicitly permitted in this standard. When dot11OCBActivated is true, the wildcard value shall be used in the BSSID field. When dot11OCBActivated is false and the BSSID field contains the wildcard value, the Address 1 (DA) field is also set to all 1s to indicate the broadcast address.

8.2.4.3.5 DA field

The DA field contains an IEEE MAC individual or group address that identifies the MAC entity or entities intended as the final recipient(s) of the MSDU (or fragment thereof) or A-MSDU, as defined in 8.3.2.1, contained in the frame body field.

8.2.4.3.6 SA field

The SA field contains an IEEE MAC individual address that identifies the MAC entity from which the transfer of the MSDU (or fragment thereof) or A-MSDU, as defined in 8.3.2.1, contained in the frame body field was initiated. The individual/group bit is always transmitted as a 0 in the source address.

8.2.4.3.7 RA field

The RA field contains an IEEE MAC individual or group address that identifies the intended immediate recipient STA(s), on the WM, for the information contained in the frame body field.

8.2.4.3.8 TA field

The TA field contains an IEEE MAC individual address that identifies the STA that has transmitted, onto the WM, the MPDU contained in the frame body field. The Individual/Group bit is always transmitted as a 0 in the transmitter address.

8.2.4.4 Sequence Control field

8.2.4.4.1 Sequence Control field structure

The Sequence Control field is 16 bits in length and consists of two subfields, the Sequence Number and the Fragment Number. The format of the Sequence Control field is illustrated in Figure 8-3. The sequence Control field is not present in control frames.

```
+-----+-----+-----+-----+
| B0  | B3  | B4  | B15 |
+-----+-----+-----+-----+
| Fragment Number | Sequence Number |
+-----+-----+-----+-----+
```

**Figure 8-3—Sequence Control field**
8.2.4.4.2 Sequence Number field

The Sequence Number field is a 12-bit field indicating the sequence number of an MSDU, A-MSDU, or MMPDU. Each MSDU, A-MSDU, or MMPDU transmitted by a STA is assigned a sequence number. Sequence numbers are not assigned to control frames, as the Sequence Control field is not present.

Each fragment of an MSDU or MMPDU contains a copy of the sequence number assigned to that MSDU or MMPDU. The sequence number remains constant in all retransmissions of an MSDU, MMPDU, or fragment thereof.

8.2.4.4.3 Fragment Number field

The Fragment Number field is a 4-bit field indicating the number of each fragment of an MSDU or MMPDU. The fragment number is set to 0 in the first or only fragment of an MSDU or MMPDU and is incremented by one for each successive fragment of that MSDU or MMPDU. The fragment number is set to 0 in the only fragment of an A-MSDU. The fragment number remains constant in all retransmissions of the fragment.

8.2.4.5 QoS Control field

8.2.4.5.1 QoS Control field structure

The QoS Control field is a 16-bit field that identifies the TC or TS to which the frame belongs as well as various other QoS-related, A-MSDU related, and mesh-related information about the frame that varies by frame type, subtype, and type of transmitting STA. The QoS Control field is present in all data frames in which the QoS subfield of the Subtype field is equal to 1 (see 8.2.4.1.3). Each QoS Control field comprises five or eight subfields, as defined for the particular sender (HC or non-AP STA) and frame type and subtype. The usage of these subfields and the various possible layouts of the QoS Control field are described 8.2.4.5.2 to 8.2.4.5.12 and illustrated in Table 8-4.

See 9.12.1 for constraints on the contents of the QoS Control field when present in an A-MPDU.

<td>TID</td>
<td>1</td>
<td>Ack Policy</td>
<td>A-MSDU Present</td>
<td>Queue Size</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The TID subfield identifies the TC or TS to which the corresponding MSDU (or fragment thereof) or A-MSDU in the Frame Body field belongs. The TID subfield also identifies the TC or TS of traffic for which a TXOP is being requested, through the setting of TXOP duration requested or queue size. The encoding of the TID subfield depends on the access policy (see 8.4.2.32) and is shown in Table 8-5. Additional information on the interpretation of the contents of this field appears in 5.1.1.4.

### Table 8-5—TID subfield

<table>
<thead>
<tr>
<th>Access policy</th>
<th>Usage</th>
<th>Allowed values in bits 0–3 (TID subfield)</th>

<td>HCCA</td>
<td>TSID</td>
<td>8–15</td>
</tr>
<tr>
<td>HEMM</td>
<td>TSID, regardless of the access mechanism used</td>
<td>8–15</td>
</tr>
</tbody>
</table>

For QoS Data+CF-Poll, the TID subfield in the QoS Control field indicates the TID of the data. For all QoS (+)CF-Poll frames of subtype Null, the TID subfield in the QoS Control field indicates the TID for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. For STAs where dot11OCBActivated is true, traffic streams are not used and the TID always corresponds to a TC.
8.2.4.5.3 EOSP (end of service period) subfield

The EOSP subfield is 1 bit in length and is used by the HC to indicate the end of the current service period (SP). The HC sets the EOSP subfield to 1 in its transmission and retransmissions of the SP’s final frame to end a scheduled/unscheduled SP and sets it to 0 otherwise.

The mesh STA uses the EOSP subfield to indicate the end of the current mesh peer service period (MPSP) in which it operates as the owner. The mesh STA sets the EOSP subfield to 1 in its transmission and retransmissions of the MPSP’s final frame to end an MPSP, and sets it to 0 otherwise. See 13.14.9.4 for details.

8.2.4.5.4 Ack Policy subfield

The Ack Policy subfield is 2 bits in length and identifies the acknowledgment policy that is followed upon the delivery of the MPDU. The interpretation of these 2 bits is given in Table 8-6.

<table>
<thead>
<tr>
<th>Bits in QoS Control field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 5</td>
<td>Bit 6</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>
An MSDU is sent using an acknowledgment policy of Normal Ack, Implicit Block Ack Request, PSMP Ack or Block Ack if the service class parameter in the MA-UNITDATA.request primitive is QoSAck and of No Ack if the service class parameter in the MA-UNITDATA.request primitive is equal to QoSNoAck.

### 8.2.4.5.5 TXOP Limit subfield

The TXOP Limit subfield is an 8-bit field that is present in QoS data frames of subtypes that include CF-Poll and specifies the time limit on a TXOP granted by a QoS (+)CF-Poll frame from an HC in a BSS. In QoS data frames with subtypes that include CF-Poll, the addressed STA is granted a TXOP that begins a SIFS period after this frame and lasts no longer than the number of $32 \times 10^6 \mu s$ periods specified by the TXOP limit value. The range of time values is $32 \times 10^6 \mu s$ to $8160 \times 10^6 \mu s$. A TXOP limit value of 0 implies that one MPDU or one QoS Null frame is to be transmitted immediately following the QoS (+)CF-Poll frame.

### 8.2.4.5.6 Queue Size subfield

The Queue Size subfield is an 8-bit field that indicates the amount of buffered traffic for a given TC or TS at the STA sending this frame. The Queue Size subfield is present in QoS data frames sent by non-AP STAs with bit 4 of the QoS Control field equal to 1. The AP may use information contained in the Queue Size subfield to determine the TXOP duration assigned to the STA.

The queue size value is the total size, rounded up to the nearest multiple of 256 octets and expressed in units of 256 octets, of all MSDUs and A-MSDUs buffered at the STA (excluding the MSDU or A-MSDU of the present QoS data frame) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field. A queue size value of 0 is used solely to indicate the
absence of any buffered traffic in the queue used for the specified TID. A queue size value of 254 is used for all sizes greater than 64 768 octets. A queue size value of 255 is used to indicate an unspecified or unknown size. If a QoS data frame is fragmented, the queue size value may remain constant in all fragments even if the amount of queued traffic changes as successive fragments are transmitted.

8.2.4.5.7 TXOP Duration Requested subfield

The TXOP Duration Requested subfield is present in QoS data frames sent by STAs associated in a BSS with bit 4 of the QoS Control field equal to 0. The TXOP Duration Requested subfield is an 8-bit field that indicates the duration, in units of 32 μs, that the sending STA determines it needs for its next TXOP for the specified TID. A value of 0 indicates that no TXOP is requested for the specified TID in the current SP. A nonzero value represents a requested TXOP duration in the range 32 μs to 8 160 μs in increments of 32 μs. See 9.19.3.5.2.

8.2.4.5.8 AP PS Buffer State subfield

The AP PS Buffer State subfield, defined in Figure 8-4, is an 8-bit field that indicates the PS buffer state at the AP for a STA. The AP PS Buffer State subfield is further subdivided into three subfields: Buffer State Indicated, Highest-Priority Buffered AC, and AP Buffered Load.

<table>
<thead>
<tr>
<th>Bits:</th>
<th>1</th>
<th>1</th>
<th>2</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved</td>
<td>Buffer State Indicated</td>
<td>Highest Priority Buffered AC</td>
<td>QoS AP Buffered Load</td>
<td></td>
</tr>
</tbody>
</table>

Figure 8-4—QoS AP PS Buffer State subfield

The Buffered State Indicated subfield is 1 bit in length and is used to indicate whether the AP PS buffer state is specified. A value of 1 indicates that the AP PS buffer state is specified.

The Highest-Priority Buffered AC subfield is 2 bits in length and is used to indicate the AC of the highest priority traffic remaining that is buffered at the AP, excluding the MSDU or A-MSDU of the present frame.

The AP Buffered Load subfield is 4 bits in length and is used to indicate the total buffer size, rounded up to the nearest multiple of 4096 octets and expressed in units of 4096 octets, of all MSDUs and A-MSDUs buffered at the QoS AP (excluding the MSDU or A-MSDU of the present QoS data frame). An AP Buffered Load field value of 15 indicates that the buffer size is greater than 57 344 octets. An AP Buffered Load subfield value of 0 is used solely to indicate the absence of any buffered traffic for the indicated highest priority buffered AC when the Buffer State Indicated bit is 1.

When the Buffered State Indicated subfield is equal to 0, the Highest-Priority Buffered AC subfield and the AP Buffered Load subfield are reserved.

8.2.4.5.9 A-MSDU Present subfield

The A-MSDU Present subfield is 1 bit in length and indicates the presence of an A-MSDU. The A-MSDU Present subfield is set to 1 to indicate that the Frame Body field contains an entire A-MSDU as defined in 8.3.2.2. The A-MSDU Present subfield is set to 0 to indicate that the Frame Body field contains an MSDU or fragment thereof as defined in 8.3.2.1.
8.2.4.5.10 Mesh Control Present subfield

The Mesh Control Present subfield is 1 bit in length, and indicates the presence of a Mesh Control field in the frame body. When the Mesh Control Present subfield is 1, the Frame Body field contains a Mesh Control field as defined in 8.2.4.7.3. The mesh STA sets the Mesh Control Present subfield to 1 in the Mesh Data frame containing an unfragmented MSDU, an A-MSDU, or the first fragment of an MSDU.

8.2.4.5.11 Mesh Power Save Level subfield

The Mesh Power Save Level subfield is 1 bit in length and indicates whether the mesh STA’s peer-specific mesh power mode will be deep sleep mode or light sleep mode after the successful completion of the frame exchange sequence.

When the Power Management field in the Frame Control field in the frame is 1, the following applies:

In individually addressed Mesh Data frames, a value of 0 indicates that the mesh STA’s peer-specific mesh power mode for the recipient mesh STA will be light sleep mode (see 13.14.8.4). In individually addressed Mesh Data frames, a value of 1 indicates that the mesh STA’s peer-specific mesh power mode for the recipient mesh STA will be deep sleep mode (see 13.14.8.5).

In group addressed Mesh Data frames, a value of 0 indicates that none of the peer-specific mesh power modes of the mesh STA will be deep sleep mode. In group addressed Mesh Data frames, a value of 1 indicates that at least one of the peer-specific mesh power modes of the mesh STA is deep sleep mode.

The Mesh Power Save Level subfield is reserved if the Power Management field in the Frame Control field is 0.

8.2.4.5.12 Receiver Service Period Initiated (RSPI) subfield

The Receiver Service Period Initiated (RSPI) subfield is 1 bit in length. The subfield is set to 0 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is not initiated. The subfield is set to 1 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is initiated. The use of the RSPI subfield is described in 13.14.9.2. The RSPI subfield is reserved in group addressed frames.

8.2.4.6 HT Control field

The HT Control field is always present in a Control Wrapper frame and is present in QoS Data and management frames as determined by the Order bit of the Frame Control field as defined in 8.2.4.1.10.

NOTE—The only Control frame subtype for which HT Control field is present is the Control Wrapper frame. A control frame that is described as +HTC (e.g., RTS+HTC, CTS+HTC, BlockAck+HTC or BlockAckReq+HTC) implies the use of the Control Wrapper frame to carry that control frame.

The format of the 4-octet HT Control field is shown in Figure 8-5.

**NOTE**—If the HT Control field is carried in a sounding PPDU, then the value of the ASEL Data field contains the remaining number of sounding frames following the current one. If null data packet (NDP) sounding frame is used, then the value in the ASEL Data field contains the number of NDPs following a non-NDP-HTC. The NDP Announcement subfield in the HT Control field is set to 1 to indicate NDP sounding.
The Calibration Position and Calibration Sequence subfields of the HT Control field are defined in Table 8-10.

The Calibration Sequence subfield identifies an instance of the calibration procedure. The subfield is included in each frame within a calibration procedure, and its value is unchanged for frames within the same calibration procedure.

<table>
<thead>
<tr>

#### 8.2.4.7 Frame Body field

**8.2.4.7.1 General**

The Frame Body is a variable-length field that contains information specific to individual frame types and subtypes. The minimum length of the frame body is 0 octets. The maximum length of the frame body is defined by the maximum length MSDU plus the length of Mesh Control field as defined in 8.2.4.7.3, if present, plus any overhead for encryption as defined in Clause 11, or by the maximum length A-MSDU plus any overhead for encryption as defined in Clause 11.

**8.2.4.7.2 Overhead for encryption**

The overhead for encryption is described in Clause 11. When the Mesh Control field is present in the frame body, the Mesh Control field is encrypted as a part of data.

**8.2.4.7.3 Mesh Control field**

The Mesh Control field is present in the unfragmented Mesh Data frame, in the first fragment of the Mesh Data frame, and in the management frame of subtype Action, Category Multihop Action (Multihop Action frame) transmitted by a mesh STA.

In Mesh Data frames, when the Mesh Control Present subfield in the QoS Control field is 1, the Mesh Control field is prepended to the MSDU and located as follows:

- When the frame body contains an MSDU (or a fragment thereof) and the frame is not encrypted, the Mesh Control field is located in the first octets of the frame body.
- When the frame body contains an MSDU (or a fragment thereof) and the frame is encrypted, the Mesh Control field is located in the first octets of the encrypted data portion.
- When the frame body contains an A-MSDU, the Mesh Control field is located in the Aggregate MSDU subframe header as shown in Figure 8-33.

In the Multihop Action frame, the Mesh Control field is present as specified in 8.5.18.

The Mesh Control field is of variable length (6, 12, or 18 octets). The structure of the Mesh Control field is defined in Figure 8-9.
The Mesh Flags subfield is 1 octet in length and contains the Address Extension Mode subfield. The structure of the Mesh Flags subfield is shown in Figure 8-10.

```
B0  B1  B2  B7
Address Extension Mode  Reserved
```

Figure 8-10—Mesh Flags subfield

The Address Extension Mode subfield indicates the contents of the Mesh Address Extension subfield. Table 8-14 defines valid values for the Address Extension Mode and describes the corresponding contents of the Mesh Address Extension subfield. If the Address Extension Mode is 0, the Mesh Address Extension subfield is not present. For values 1 and 2, the Mesh Address Extension subfield is present following the Mesh Sequence Number subfield.

<table>

<td>Data (proxied, individually addressed)</td>
</tr>
<tr>
<td>3</td>
<td>Reserved</td>
<td>—</td>
<td>—</td>
</tr>
</tbody>
</table>

Table 8-14—Valid values for the Address Extension Mode

The Mesh TTL subfield is 1 octet in length and contains an unsigned integer corresponding to the remaining number of hops the MSDU/MMPDU is forwarded. How the Mesh TTL is used in both individually and group addressed frames is described in 9.32.4 and 9.32.5.

The Mesh Sequence Number subfield is 4 octets in length and contains an unsigned integer sequence number counter value. Source mesh STAs assign mesh sequence numbers from a single modulo-2^{32} counter, starting at 0 and incrementing by 1 for each MSDU or MMPDU that is transmitted with a Mesh Control field. Usage of the Mesh Sequence Number is described in 9.32.7.
NOTE—It is believed that a 32-bit sequence number is sufficient as the rollover would occur after a period of 5 days assuming a source continuously transmitting at a rate of $10^4$ frames per second.

The Mesh Address Extension subfield, shown in Figure 8-11, is 6 or 12 octets in length and is present only when the Address Extension Mode subfield of the Mesh Flags subfield is a nonzero nonreserved value. The Mesh Address Extension subfield provides additional address fields for mesh address extension as defined in Table 8-14. The interpretation of the extended Address fields is described in 9.32.3.

<table>
<thead>
<tr>
<th>Address 4</th>
<th>Address 5</th>
<th>Address 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>6</td>
<td>6</td>
</tr>
</tbody>
</table>

Figure 8-11—Mesh Address Extension subfield

The Address 4 subfield is present when the Address Extension Mode subfield in the Mesh Flags subfield is 1. It carries a fourth address that is not included as a part of the MAC header for these frames.

The Address 5 subfield and Address 6 subfield are present when the Address Extension Mode subfield in the Mesh Flags subfield is 2. It carries the addresses of source and destination end station of the end-to-end IEEE 802 communication in cases where either (or both) of the end stations are not mesh STAs at the beginning or end of a single mesh path. (See Figure 9-42.)

NOTE—This is useful, for example, when the end stations of IEEE 802 communication are nonmesh, external STAs that communicate over a mesh BSS via proxy mesh gates.

Details on the usage of these optional address fields are given in 9.32.3.

8.2.4.8 FCS field

The FCS field is a 32-bit field containing a 32-bit CRC. The FCS is calculated over all the fields of the MAC header and the Frame Body field. These are referred to as the calculation fields.

The FCS is calculated using the following standard generator polynomial of degree 32:

\[ G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1 \]

The FCS is the ones complement of the sum (modulo 2) of the following:

a) The remainder of \( x^k \times (x^{31} + x^{30} + x^{29} + \ldots + x^2 + x + 1) \) divided (modulo 2) by \( G(x) \), where \( k \) is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by \( x^{32} \) and then division by \( G(x) \).

The FCS field is transmitted commencing with the coefficient of the highest-order term.

As a typical implementation, at the transmitter, the initial remainder of the division is preset to all ones and is then modified by division of the calculation fields by the generator polynomial \( G(x) \). The ones complement of this remainder is transmitted, with the highest-order bit first, as the FCS field.

At the receiver, the initial remainder is preset to all ones and the serial incoming bits of the calculation fields and FCS, when divided by \( G(x) \), results (in the absence of transmission errors) in a unique nonzero remainder value. The unique remainder value is the polynomial:

\[ x^{31} + x^{30} + x^{26} + x^{25} + x^{24} + x^{18} + x^{15} + x^{14} + x^{12} + x^{11} + x^{10} + x^8 + x^6 + x^5 + x^4 + x^3 + x + 1 \]
8.2.5 Duration/ID field (QoS STA)

8.2.5.1 General

The value in the Duration/ID field in a frame transmitted by a QoS STA is defined in 8.2.5.2 through 8.2.5.8.

All times are calculated in microseconds. If a calculated duration includes a fractional microsecond, that value inserted in the Duration/ID field is rounded up to the next higher integer.

8.2.5.2 Setting for single and multiple protection under enhanced distributed channel access (EDCA)

Within a frame (excluding data frames containing QoS CF-Poll, PSMP frames, and frames that have the RDG/More PPDU subfield equal to 1) transmitted under EDCA by a STA that initiates a TXOP, there are two classes of duration settings: single protection and multiple protection. In single protection, the value of the Duration/ID field of the frame can set a NAV value at receiving STAs that protects up to the end of any following data, management, or response frame plus any additional overhead frames as described below. In multiple protection, the value of the Duration/ID field of the frame can set a NAV that protects up to the estimated end of a sequence of multiple frames. Frames that have the RDG/More PPDU subfield equal to 1 always use multiple protection. PSMP frames always use multiple protection. The STA selects between single and multiple protection when it transmits the first frame of a TXOP. All subsequent frames transmitted by the STA in the same TXOP use the same class of duration settings.

The Duration/ID field is determined as follows:

a) Single protection settings.
   1) For an RTS that is not part of a dual clear-to-send (CTS) exchange, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame, plus one CTS frame, plus one ACK or BlockAck frame if required, plus any NDPs required, plus explicit feedback if required, plus applicable IFS durations.
   2) For all CTS frames sent by STAs as the first frame in the exchange under EDCA and with the receiver address (RA) matching the MAC address of the transmitting STA, the Duration/ID field is set to one of the following:
      i) If there is a response frame, the estimated time required to transmit the pending frame, plus one SIFS interval, plus the response frame (ACK or BlockAck), plus any NDPs required, plus explicit feedback if required, plus an additional SIFS interval
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS interval
   3) For a BlockAckReq frame, the Duration/ID field is set to the estimated time required to transmit one ACK or BlockAck frame, as applicable, plus one SIFS interval.
   4) For a BlockAck frame that is not sent in response to a BlockAckReq or an implicit Block Ack request, the Duration/ID field is set to the estimated time required to transmit an ACK frame plus a SIFS interval.
   5) For management frames, non-QoS data frames (i.e., with bit 7 of the Frame Control field equal to 0), and individually addressed data frames with the Ack Policy subfield equal to Normal Ack only, the Duration/ID field is set to one of the following:
      i) If the frame is the final fragment of the TXOP, the estimated time required for the transmission of one ACK frame (including appropriate IFS values)
      ii) Otherwise, the estimated time required for the transmission of one ACK frame, plus the time required for the transmission of the following MPDU and its response if required, plus applicable IFS durations.
6) For individually addressed QoS data frames with the Ack Policy subfield equal to No Ack or Block Ack, for management frames of subtype Action No Ack, and for group addressed frames, the Duration/ID field is set to one of the following:
   i) If the frame is the final fragment of the TXOP, 0
   ii) Otherwise, the estimated time required for the transmission of the following frame and its response frame, if required (including appropriate IFS values)

b) Multiple protection settings. The Duration/ID field is set to a value D as follows:
   1) If $T_{TXOP} = 0$ and $T_{END-NAV} = 0$, then $D = T_{SINGLE-MSDU} - T_{PPDU}$
   2) Else if $T_{TXOP} = 0$ and $T_{END-NAV} > 0$, then $D = T_{END-NAV} - T_{PPDU}$
   3) Else if $T_{END-NAV} = 0$, then $min(T_{PENDING}, T_{TXOP} - T_{PPDU}) \leq D \leq T_{TXOP} - T_{PPDU}$
   4) Else $T_{END-NAV} - T_{PPDU} \leq D \leq T_{TXOP-REMAINING} - T_{PPDU}$

where
- $T_{SINGLE-MSDU}$ is the estimated time required for the transmission of the allowed frame exchange sequence defined in 8.4.2.31 (for a TXOP limit value of 0), including applicable IFS durations
- $T_{PENDING}$ is the estimated time required for the transmission of
  - Pending MPDUs of the same AC
  - Any associated immediate response frames
  - Any NDP transmissions and explicit feedback response frames
  - Applicable IFS durations
  - Any RDG
- $T_{TXOP}$ is the value of $T_{TXOP}$TableTXOPLimit (dot11EDCAQAPTableTXOPLimit for the AP) for that AC
- $T_{TXOP-REMAINING}$ is $T_{TXOP}$ less the time already used time within the TXOP
- $T_{END-NAV}$ is the remaining duration of any NAV set by the TXOP holder, or 0 if no NAV has been established
- $T_{PPDU}$ is the time required for transmission of the current PPDU

8.2.5.3 Setting for QoS CF-Poll frames

Within a data frame containing QoS CF-Poll, the Duration/ID field value is set to one of the following:
   a) One SIFS duration plus the TXOP limit, if the TXOP limit is nonzero, or
   b) The time required for the transmission of one MPDU of nominal MSDU size and the associated ACK frame plus two SIFS intervals, if the TXOP limit is 0.

8.2.5.4 Setting for frames sent by a TXOP holder under HCCA

Within a frame sent by a TXOP holder under hybrid coordination function (HCF) controlled channel access (HCCA), to provide NAV protection for the entire controlled access phase (CAP), the Duration/ID field is set to one of the following values:
   a) For an RTS frame
      1) If the pending frame is the final frame, the time required to transmit the pending frame, plus one CTS frame, plus one ACK frame if required, plus three SIFS intervals
      2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
b) For a CTS frame
   1) If the pending frame is the sole frame in the TXOP, one of the following:
      i) If there is a response frame, the time required to transmit the pending frame, plus one SIFS interval, plus the response frame (ACK or BlockAck), plus an additional SIFS interval
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS interval
   2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP

c) Otherwise
   1) If the frame is a nonfinal frame in a TXOP with multiple frame exchanges, the remaining duration of the TXOP
   2) If the frame is the sole or final frame in the TXOP, the actual remaining time needed for this frame exchange sequence

8.2.5.5 Settings within a PSMP sequence

Within a PSMP frame, the Duration/ID field is set to a value that is no less than the time required to complete all PSMP-DTT and PSMP-UTT periods described in the frame.

Within the PSMP-DTT and PSMP-UTT of a PSMP sequence, the Duration/ID field is set to the Duration/ID value of the preceding PSMP frame minus the time between the end of the PSMP frame and the end of the PPDU carrying the frame.

NOTE—In other words, all frames transmitted within a PSMP sequence locate the same NAV endpoint.

8.2.5.6 Settings within a dual CTS sequence

Within a frame (“Frame1”) (excluding a second CTS (CTS2) transmission, as defined in 9.3.2.7) sent by a QoS STA that is not a TXOP holder in a PPDU that contains an immediate response or that is sent by an RD responder, the Duration/ID field is set to the Duration/ID value from the frame(s) (“Frames2”) that elicited the response or that carried the RDG minus the time interval between the end of the PPDU that carried Frame1 and the end of the PPDU that carries Frames2.

Within a frame (“Frame1”) (excluding a CTS2 transmission, as defined in 9.3.2.7) sent by a QoS STA that is a TXOP holder, the Duration/ID field is set according to the rules in the following subclauses:
   — 8.2.5.2 rule b) for multiple protection if Frame1 is not a QoS+CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
   — 8.2.5.3 if Frame1 is a QoS+CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
   — 8.2.5.4 if the TXOP holder is operating under HCCA
   — 8.2.5.5 if the TXOP holder is operating under PSMP

Within the CTS2 of a dual CTS exchange, defined in 9.3.2.7, the Duration/ID field is set to the value of the Duration/ID field of the RTS that initiated the exchange minus the time required to transmit the first clear-to-sent (CTS1), CTS2, and the applicable IFS intervals.

8.2.5.7 Setting for control response frames

This subclause describes how to set the Duration/ID field for CTS, ACK, and BlockAck control response frames transmitted by a QoS STA.

For a CTS frame that is not part of a dual CTS sequence transmitted in response to an RTS frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the
response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the PPDU carrying the CTS frame.

For an ACK frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the ACK frame.

For a BlockAck frame transmitted in response to a BlockAckReq frame or transmitted in response to a frame containing an implicit Block Ack request, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the BlockAck frame.

8.2.5.8 Setting for other response frames

For any frame transmitted by a STA that is not the TXOP holder and is not specified by 8.2.5.1 through 8.2.5.7, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the frame.

8.3 Format of individual frame types

8.3.1 Control frames

8.3.1.1 Format of control frames

In the following descriptions, “immediately previous” frame means a frame whose reception concluded within the SIFS interval preceding the start of the current frame.

The subfields within the Frame Control field of control frames are set as illustrated in Figure 8-12.

Bits: 2 2 4 1 1 1 1 1 1 1 1 1 1 1

Figure 8-12—Frame Control field subfield values within control frames

8.3.1.2 RTS frame format

The frame format for the RTS frame is as defined in Figure 8-13.
The RA field of the RTS frame is the address of the STA, on the WM, that is the intended immediate recipient of the pending individually addressed data, management, or control frame.

The TA field is the address of the STA transmitting the RTS frame.

For all RTS frames sent by non-QoS STAs, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus one CTS frame, plus one ACK frame, plus three SIFS intervals. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. For RTS frames sent by QoS STAs, see 8.2.5.

8.3.1.3 CTS frame format

The frame format for the CTS frame is as defined in Figure 8-14.

![Figure 8-14—CTS frame]

When the CTS frame follows an RTS frame, the RA field of the CTS frame is copied from the TA field of the immediately previous RTS frame to which the CTS is a response. When the CTS is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

For all CTS frames transmitted by a non-QoS STA in response to RTS frames, the duration value is the value obtained from the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the CTS frame and its SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

At a non-QoS STA, if the CTS is the first frame in the exchange and the pending data or management frame requires acknowledgment, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus two SIFS intervals plus one ACK frame. At a non-QoS STA, if the CTS is the first frame in the exchange and the pending data or management frame does not require acknowledgment, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus one SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For other CTS transmissions by a QoS STA, the duration value is set as defined in 8.2.5.

8.3.1.4 ACK frame format

The frame format for the ACK frame is as defined in Figure 8-15.

![Figure 8-15—ACK frame]
The RA field of the ACK frame is copied from the Address 2 field of the immediately previous individually addressed data, management, BlockAckReq, BlockAck, or PS-Poll frames.

For ACK frames sent by non-QoS STAs, if the More Fragments bit was equal to 0 in the Frame Control field of the immediately previous individually addressed data or management frame, the duration value is set to 0. In other ACK frames sent by non-QoS STAs, the duration value is the value obtained from the Duration/ID field of the immediately previous data, management, PS-Poll, BlockAckReq, or BlockAck frame minus the time, in microseconds, required to transmit the ACK frame and its SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

In all other ACK frames, the duration value is specified by 8.2.5.

**8.3.1.5 PS-Poll frame format**

The frame format for the PS-Poll frame is as defined in Figure 8-16.

![Figure 8-16—PS-Poll frame](image)

The BSSID is the address of the STA contained in the AP. The TA field is the address of the STA transmitting the frame. The AID is the value assigned to the STA transmitting the frame by the AP in the association response frame that established that STA’s current association.

The AID value always has its two MSBs set to 1.

**8.3.1.6 CF-End frame format**

The frame format for the CF-End frame is as defined in Figure 8-17.

![Figure 8-17—CF-End frame](image)

The BSSID field is the address of the STA contained in the AP. The RA field is the broadcast group address. The Duration field is set to 0.
8.3.1.7 CF-End+CF-Ack frame format

The frame format for the CF-End+CF-Ack frame is as defined in Figure 8-18.

![Figure 8-18—CF-End+CF-Ack frame](image)

The BSSID field is the address of the STA contained in the AP. The RA field is the broadcast group address. The Duration field is set to 0.

8.3.1.8 BlockAckReq frame format

8.3.1.8.1 Overview

The frame format of the BlockAckReq frame is defined in Figure 8-19.

![Figure 8-19—BlockAckReq frame](image)

The Duration/ID field value is set as defined in 8.2.5.

The RA field of the BlockAckReq frame is the address of the recipient STA.

The TA field is the address of the STA transmitting the BlockAckReq frame.

The BAR Control field is shown in Figure 8-20.

![Figure 8-20—BAR Control field](image)

For BlockAckReq frames sent under Delayed and HT-Delayed agreements, the BAR Ack Policy subfield of the BAR Control field has the meaning shown in Table 8-15. For BlockAckReq frames sent under other types of agreement, the BAR Ack Policy subfield is reserved.
The values of the Multi-TID and Compressed Bitmap subfields determine which of three possible BlockAckReq frame variants is represented, as indicated in Table 8-16.

Table 8-16—BlockAckReq frame variant encoding

<table>
<thead>
<tr>
<th>Multi-TID subfield value</th>
<th>Compressed Bitmap subfield value</th>
<th>BlockAckReq frame variant</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>1</td>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>Multi-TID BlockAckReq</td>
</tr>
</tbody>
</table>

The meaning of the TID_INFO subfield of the BAR Control field depends on the BlockAckReq frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAckReq frame variants.

The meaning of the BAR Information field of the BlockAckReq frame depends on the BlockAckReq frame variant type. The meaning of this field is explained within the subclause for each of the BlockAckReq frame variants.

NOTE—Reference to “a BlockAckReq” frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

8.3.1.8.2 Basic BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Basic BlockAckReq frame contains the TID for which a Basic BlockAck frame is requested.

The BAR Information field of the Basic BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAckReq frame is sent. The Fragment Number subfield is set to 0.
8.3.1.8.3 Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

8.3.1.8.4 Multi-TID BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Multi-TID BlockAckReq frame determines the number of TIDs present in the Multi-TID BlockAckReq frame as given by TID_INFO + 1, e.g., a value of 2 in the TID_INFO subfield means that three TID values are present in the Multi-TID BlockAckReq frame’s BAR Information field.

The BAR Information field of the Multi-TID BlockAckReq frame comprises multiple sets of Per TID Info subfields and Block Ack Starting Sequence Control subfields, as shown in Figure 8-22. The Per TID Info subfield is shown in Figure 8-23. The Block Ack Starting Sequence Control subfield is shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.
8.3.1.9 BlockAck frame format

8.3.1.9.1 Overview

The frame format of the BlockAck frame is defined in Figure 8-24.

![Figure 8-24—BlockAck frame](image)

The Duration/ID field value is set as defined in 8.2.5.

The RA field of the BlockAck frame is the address of the recipient STA that requested the Block Ack.

The TA field is the address of the STA transmitting the BlockAck frame.

The BA Control field is defined in Figure 8-25.

![Figure 8-25—BA Control field](image)

For BlockAck frames sent under Delayed and HT-Delayed agreements, the BA Ack Policy subfield of the BA Control field has the meaning shown in Table 8-17. For BlockAck frames sent under other types of agreement, the BA Ack Policy subfield is reserved.

### Table 8-17—BA Ack Policy subfield

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Normal Acknowledgment. The BA Ack Policy subfield is set to this value when the sender requires immediate acknowledgment. The addressee returns an ACK. The value 0 is not used for data sent under HT-delayed BlockAck during a PSMP sequence.</td>
</tr>
<tr>
<td>1</td>
<td>No Acknowledgment. The addressee sends no immediate response upon receipt of the frame. The BA Ack Policy is set to this value when the sender does not require immediate acknowledgment. The value 1 is not used in a Basic BlockAck frame outside a PSMP sequence. The value 1 is not used in an Multi-TID BlockAck frame.</td>
</tr>
</tbody>
</table>
The values of the Multi-TID and Compressed Bitmap subfields of the BA Control field determine which of three possible BlockAck frame variants is represented, as indicated in the Table 8-18.

NOTE—Reference to “a BlockAck” frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

The meaning of the TID_INFO subfield of the BA Control field depends on the BlockAck frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAck frame variants.

The meaning of the BA Information field depends on the BlockAck frame variant type. The meaning of this field is explained within the subclause for each of the BlockAck frame variants.

8.3.1.9.2 Basic BlockAck variant

The TID_INFO subfield of the BA Control field of the Basic BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Basic BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 8-26. The format of the Block Ack Starting Sequence Control subfield is shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAck frame is sent and is set to the same value as in the immediately previously received Basic BlockAckReq frame.

Figure 8-26—BA Information field (BlockAck)

The Block Ack Bitmap subfield is 128 octets in length and is used to indicate the received status of up to 64 MSDUs. Bit position \( n \) of the Block Ack bitmap, if equal to 1, acknowledges receipt of an MPDU with an MPDU sequence control value equal to \((\text{Block Ack Starting Sequence Control} + n)\). Bit position \( n \) of the Block Ack bitmap, if equal to 0, indicates that an MPDU with MPDU sequence control value equal to \((\text{Block Ack Starting Sequence Control} + n)\) has not been received. Each of the MPDU Sequence Control field and Block Ack Starting Sequence Control subfield values are treated as a 16-bit unsigned integer. For unused fragment numbers of an MSDU, the corresponding bits in the bitmap are set to 0.
8.3.1.9.3 Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Compressed BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 8-27. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 9.21.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

\[
\begin{array}{|c|c|}
\hline
\text{Block Ack Starting Sequence Control} & \text{Block Ack Bitmap} \\
\hline
\end{array}
\]

Octets: 2 8

Figure 8-27—BA Information field (Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame is 8 octets in length and is used to indicate the received status of up to 64 MSDUs and A-MSDUs. Each bit that is equal to 1 in the compressed Block Ack bitmap acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

8.3.1.9.4 Multi-TID BlockAck variant

The TID_INFO subfield of the BA Control field of the Multi-TID BlockAck frame contains the number of TIDs, less one, for which information is reported in the BA Information field. For example, a value of 2 in the TID_INFO subfield means that information for three TIDs is present.

The BA Information field of the Multi-TID BlockAck frame comprises 1 or more instances of the Per TID Info, Block Ack Starting Sequence Control, and the Block Ack Bitmap subfields, as shown in Figure 8-28. The Per TID Info subfield is shown in Figure 8-23, and the Block Ack Starting Sequence Control subfield is shown in Figure 8-21.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield is the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 9.21.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0. The first instance of the Per TID Info, Block Ack Starting Sequence Control, and Block Ack Bitmap subfields that is transmitted corresponds to the lowest TID value, with subsequent instances ordered by increasing values of the Per TID Info subfield.

\[
\begin{array}{|c|c|c|}
\hline
\text{Per TID Info} & \text{Block Ack Starting Sequence Control} & \text{Block Ack Bitmap} \\
\hline
\end{array}
\]

Octets: 2 2 8

Repeat for each TID

Figure 8-28—BA Information field (Multi-TID BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Multi-TID BlockAck frame contains an 8-octet Block Ack bitmap. Each bit that is equal to 1 in the Block Ack bitmap acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number with the first bit of the Block Ack
bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

### 8.3.1.10 Control Wrapper frame

The format of the Control Wrapper frame is shown in Figure 8-29.

![Figure 8-29—Control Wrapper frame](image)

The Control Wrapper frame is used to carry any other control frame (i.e., excluding the Control Wrapper frame) together with a HT Control field.

The Frame Control field is defined in 8.3.1. The value for the subtype field is the value from Table 8-1 of 8.2.4.1.3 that corresponds to Control Wrapper frame.

The value for the Duration/ID field of the Control Wrapper frame is generated by following the rules for the Duration/ID field of the control frame that is being carried.

The value for the Address 1 field of the Control Wrapper frame is generated by following the rules for the Address 1 field of the control frame that is being carried.

The Carried Frame Control field contains the value of the Frame Control field of the carried control frame.

The HT Control field is defined in 8.2.4.6.

The Carried Frame field contains the fields that follow the Address 1 field of the control frame that is being carried, excluding the FCS field.

The FCS field is defined in 8.2.4.8.

### 8.3.2 Data frames

#### 8.3.2.1 Data frame format

The format of a data frame is defined in Figure 8-30. The Frame Control, Duration/ID, Address 1, Address 2, Address 3, and Sequence Control fields are present in all data frame subtypes. The presence of the Address 4 field is determined by the setting of the To DS and From DS subfields of the Frame Control field (see below). The QoS Control field is present when the QoS subfield of the Subtype field is set to 1.

![Figure 8-30—Data frame](image)
NOTE—The maximum frame body size shown in Figure 8-30 is for CCMP encryption of a maximum-size A-MSDU (note that TKIP encryption is not allowed in this case and any Mesh Control fields are part of the A-MSDU subframes). The maximum frame body size if A-MSDUs are not used is 2338 octets for CCMP encryption of a maximum-size MSDU and 2342 octets for TKIP encryption of a maximum-size MSDU, including in both cases an 18-octet Mesh Control field. The frame body size might in all cases be greater if a vendor-specific cipher suite is used.

Data frames with a value of 1 in the QoS subfield of the Subtype field are collectively referred to as QoS data frames. Each of these data subtypes contains QoS in their names, and this frame format is distinguished by the presence of a QoS Control field in the MAC header.

A QoS STA always uses QoS data frames for data transmissions to other QoS STAs. A QoS STA uses frames with the QoS subfield of the Subtype field set to 0 for data transmissions to non-QoS STAs. A non-QoS STA always uses frames with the QoS subfield of the Subtype field set to 0 for data transmissions to other STAs. All STAs use frames with the QoS subfield of the Subtype field set to 0 for broadcast data frames unless a transmitting STA knows that all STAs in a BSS have QoS capability, in which case the transmitting STAs use QoS data frames. All STAs use frames with the QoS subfield of the Subtype field set to 0 for group addressed data frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs use QoS data frames.

The content of the address fields of data frames are dependent upon the values of the To DS and From DS fields in the Frame Control field and whether the Frame Body field contains either an MSDU (or fragment thereof) or an entire A-MSDU, as determined by the A-MSDU Present subfield of the QoS Control field (see 8.2.4.5.9). The content of the address fields is defined in Table 8-19. Where the content of a field is shown as not applicable (N/A), the field is omitted. Note that Address 1 always holds the receiver address of the intended receiver (or, in the case of group addressed frames, receivers), and that Address 2 always holds the address of the STA that is transmitting the frame.

</tbody>
</table>

A STA uses the contents of the Address 1 field to perform address matching for receive decisions. A mesh STA also uses the address matching rules described in 9.32.4, when it receives an individually addressed frame. When a STA other than mesh STA (nonmesh STA) receives a frame with the Address 1 field equal to a group address, the STA also validates the BSSID to verify either that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member, or that it contains the wildcard BSSID value, indicating a data frame sent outside the context of a BSS (dot11OCBActivated is true in the transmitting STA). When a mesh STA receives a frame with the Address 1 field equal to a group address, the mesh STA also validates the TA to ensure that the group addressed frame originated from one of its peer mesh STA. A mesh STA also uses the address matching rules described in 9.32.5.

A STA uses the contents of the Address 2 field to direct the acknowledgment if an acknowledgment is necessary.

The DA field contains the destination of the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.
The SA field contains the address of the MAC entity that initiated the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

When a data frame carries an MSDU (or fragment thereof), the DA and SA values related to that MSDU are carried in the Address 1, Address 2, Address 3, and Address 4 fields (according to the setting of the To DS and From DS fields) as defined in Table 8-19.

When a data frame carries an A-MSDU, the DA and SA values related to each MSDU carried by the A-MSDU are carried within the A-MSDU. One or both of these fields may also be present in the Address 1 and Address 2 fields as indicated in Table 8-19.

NOTE—If a DA or SA value also appears in any of these address fields, the value is necessarily the same for all MSDUs within the A-MSDU because this is guaranteed by the To DS and From DS field settings.

The RA field is the individual address of the STA that is the immediate intended receiver of the frame or the group address of the STAs that are the immediate intended receivers of the frame.

The TA field is the address of the STA that is transmitting the frame.

The BSSID of the Data frame is determined as follows:

a) If the STA is contained within an AP or is associated with an AP, the BSSID is the address currently in use by the STA contained in the AP.

b) If the STA is a member of an IBSS, the BSSID is the BSSID of the IBSS.

c) If the STA is transmitting a data frame when dot11OCBAactivated is true, the BSSID is the wildcard BSSID.

d) If the STA is a member of an MBSS, the BSSID is the address of the transmitter and is equal to the Data frame’s TA.

The Sequence Control field is defined in 8.2.4.4. The Sequence Control field for QoS (+)Null frames is ignored by the receiver upon reception.

The QoS Control field is defined in 8.2.4.5.

The HT Control field is defined in 8.2.4.6. The presence of the HT Control field is determined by the Order subfield of the Frame Control field, as specified in 8.2.4.1.10.

The frame body consists of either:

- The MSDU (or a fragment thereof), the Mesh Control field (present if the frame is transmitted by a mesh STA and the Mesh Control Present subfield of the QoS Control field is 1, otherwise absent), and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)
- The A-MSDU and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

The presence of an A-MSDU in the frame body is indicated by setting the A-MSDU Present subfield of the QoS Control field to 1, as shown in Table 8-4.

For data frames of subtype Null (no data), CF-Ack (no data), CF-Poll (no data), and CF-Ack+CF-Poll (no data) and for the corresponding QoS data frame subtypes, the Frame Body field is null (i.e., has a length of 0 octets); these subtypes are used for MAC control purposes. For data frames of subtypes Data, Data+CF-Ack, Data+CF-Poll, and Data+CF-Ack+CF-Poll, the Frame Body field contains all of, or a fragment of, an MSDU after any encapsulation for security. For data frames of subtypes QoS Data, QoS Data+CF-Ack, QoS Data+CF-Poll, and QoS Data+CF-Ack+CF-Poll, the Frame Body field contains an MSDU (or fragment...
thereof) or A-MSDU after any encapsulation for security. For data frames of subtype QoS Data that are transmitted by a mesh STA, the Frame Body field also contains a Mesh Control field, as described in 8.2.4.7.3.

The maximum length of the Frame Body field can be determined from the maximum MSDU length plus the length of the Mesh Control field (if present) plus any overhead from encapsulation for encryption (i.e., it is always possible to send a maximum length MSDU, with any encapsulations provided by the MAC layer within a single data MPDU). When the frame body carries an A-MSDU, the size of the frame body field is limited by:

- The PHY’s maximum PLCP service data unit (PSDU) length
- If A-MPDU aggregation is used, a maximum MPDU length of 4095 octets (see 8.6)

Within all data frames sent by STAs during the CFP under PCF, the Duration/ID field is set to 32 768. Within all data frames sent by the QoS STA, the Duration/ID field contains a duration value as defined in 8.2.5. Within all data frames sent during the CP by non-QoS STAs, the Duration/ID field is set according to the following rules:

- If the Address 1 field contains a group address, the duration value is set to 0.
- If the More Fragments bit is 0 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one ACK frame, plus one SIFS interval.
- If the More Fragments bit is 1 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this data frame, plus two ACK frames, plus three SIFS intervals.

The duration value calculation for the data frame is based on the rules in 9.7 that determine the data rate at which the control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration/ID field values less than or equal to 32 767 from valid data frames (without regard for the RA, DA, and/or BSSID address values that might be present in these frames) to update their NAV settings as appropriate under the coordination function rules.

### 8.3.2.2 A-MSDU format

An A-MSDU is a sequence of A-MSDU subframes as shown in Figure 8-31. Each A-MSDU subframe consists of an A-MSDU subframe header followed by an MSDU and 0 to 3 octets of padding as shown in Figure 8-32. Each A-MSDU subframe (except the last) is padded so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.
The A-MSDU subframe header contains three fields: DA, SA, and Length. The order of these fields and the bits within these fields are the same as the IEEE 802.3 frame format. The DA and SA fields of the A-MSDU subframe header contain the values passed in the MA-UNITDATA.request and MA-UNITDATA.indication primitives. The Length field contains the length in octets of the MSDU.

An A-MSDU contains only MSDUs whose DA and SA parameter values map to the same receiver address (RA) and transmitter address (TA) values, i.e., all the MSDUs are intended to be received by a single receiver, and necessarily they are all transmitted by the same transmitter. The rules for determining RA and TA are independent of whether the frame body carries an A-MSDU.

NOTE—It is possible to have different DA and SA parameter values in A-MSDU subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 parameter values.

The MPDU containing the A-MSDU is carried in any of the following data frame subtypes: QoS Data, QoS Data + CF-Ack, QoS Data + CF-Poll, QoS Data + CF-Ack + CF-Poll. The A-MSDU structure is contained in the frame body of a single MPDU. If encrypted, the MPDU is encrypted as a single unit.

NOTE 1—The value of TID present in the QoS Control field of the MPDU carrying the A-MSDU indicates the TID for all MSDUs in the A-MSDU. Because this value of TID is common to all MSDUs in the A-MSDU, only MSDUs delivered to the MAC by an MA-UNITDATA.request primitive with an integer priority parameter that maps to the same TID can be aggregated together using A-MSDU.

NOTE 2—The maximum MPDU length that can be transported using A-MPDU aggregation is 4095 octets. An A-MSDU cannot be fragmented. Therefore, an A-MSDU of a length that exceeds 4065 octets (4095 minus the QoS data MPDU overhead) cannot be transported in an A-MPDU.

When Mesh Data frames are aggregated, the Aggregate MSDU subframe header includes Mesh DA, Mesh SA, Length, and Mesh Control. The A-MSDU subframe structure for Mesh Data is defined in Figure 8-33.

![Figure 8-33—A-MSDU Subframe structure for Mesh Data](image)

The Mesh DA and Mesh SA fields contain the addresses of the destination mesh STA and the source mesh STA, respectively, determined in 9.32.3.

The Length field contains the length in octets of the MSDU.

The format of the Mesh Control field is described in 8.2.4.7.3.

NOTE—It is possible to have different Mesh DA, Mesh SA, and Mesh Control in Subframe Headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 values.

### 8.3.3 Management frames

#### 8.3.3.1 Format of management frames

The format of a management frame is defined in Figure 8-34. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all management frame subtypes. The maximum unencrypted MMPDU size, excluding the MAC header and FCS, is 2304 octets.
NOTE—The maximum frame body size shown in Figure 8-34 is for CCMP encryption with a maximum-size MMPDU (note TKIP encryption is not allowed and any Mesh Control field is held within the MMPDU, not as a separate header). The frame body size might be greater if a vendor-specific cipher suite is used.

A STA uses the contents of the Address 1 field to perform the address matching for receive decisions. In the case where the Address 1 field contains a group address and the frame subtype is other than Beacon or the frame subtype Action, Category Multihop Action (Multihop Action frame), the Address 3 field also is validated to verify that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member or from a mesh STA to which mesh peering is maintained. Details of addressing and forwarding of the group addressed frame in an MBSS are defined in 9.32.5. When the Address 1 field contains a group address and the frame subtype is either Probe Request or Action with Category Public, a wildcard BSSID value matches all receiving STA’s BSSIDs. If the frame subtype is Beacon, other address matching rules apply, as specified in 10.1.3.5. Frames of subtype Probe Request with a group address in the Address 1 field are additionally processed as described in 10.1.4.3.2. If the frame subtype is Action, the Category is Public, and the Action is 20/40 BSS Coexistence Management, then additional address matching rules for receive decisions apply as specified in 10.15 and 10.17.

The address fields for all management frames except Multihop Action frames are as follows:

a) The Address 1 field of the management frame is the RA (=DA) and is determined as the destination of the frame.
b) The Address 2 field of the management frame is the TA (=SA) and is determined as the address of the STA transmitting the frame.
c) The Address 3 field of the management frame is set and determined as follows:
   1) In management frames of subtype Probe Request, the Address 3 field is the BSSID. The BSSID is either a specific BSSID as described in item 4) below or the wildcard BSSID as defined in the procedures specified in 10.1.4.
   2) In management frames of subtype Action, Category Public, the Address 3 field is the BSSID. The BSSID value is set according to 10.19.
   3) If dot11OCBAActivated is true, the Address 3 field is the wildcard BSSID.
   4) Otherwise:
      i) If the STA is contained within an AP or is associated with an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
      ii) If the STA is contained within an AP or is transmitting the management frame to an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
      iii) If the STA is transmitting the management frame to one or more members of an IBSS, the Address 3 field is the BSSID of the IBSS.
      iv) If the STA is a mesh STA, the Address 3 field is the TA.

The address fields for the Multihop Action frame are as follows:

--- The Address 1 field is the RA and is determined as the address of the receiver of the frame.
— The Address 2 field is the TA and is determined as the address of the transmitter of the frame.
— The Address 3 field is the DA and is determined as the address of the destination mesh STA of the frame.

NOTE—Address 4 is included in the Mesh Control field.

Within all management frames sent by STAs during the CFP under PCF, the Duration field is set to the value 32 768. Within all management frames sent by the QoS STA, the Duration field contains a duration value as defined in 8.2.5. Within all management frames sent during the CP by non-QoS STAs, the Duration field is set according to the following rules:

— If the DA field contains a group address, the duration value is set to 0.
— If the More Fragments bit is 0 in the Frame Control field of a frame and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one ACK frame, plus one SIFS interval.
— If the More Fragments bit is 1 in the Frame Control field of a frame, and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this management frame, plus two ACK frames, plus three SIFS intervals.

The duration value calculation for the management frame is based on the rules in 9.7 that determine the data rate at which the control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid management frames to update their NAV settings as appropriate under the coordination function rules.

The HT Control field is defined in 8.2.4.6. The presence of the HT Control field is determined by the Order subfield of the Frame Control field, as specified in 8.2.4.1.10.

The frame body consists of the fields followed by the elements defined for each management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received management frame ignore that element and continue to parse the remainder of the management frame body (if any) for additional elements with recognizable element IDs. See 9.24.7. Unused element ID codes are reserved.

Gaps may exist in the ordering of fields and elements within frames. The order that remains is ascending.

8.3.3.2 Beacon frame format

The frame body of a management frame of subtype Beacon contains the information shown in Table 8-20.

</tr>
</tbody>
</table>
13 Fast BSS Transition

An FTE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3, 00-0F-AC:4, or 00-0F-AC:9 (i.e., part of a fast BSS transition in an RSN).

14 Resource information container (RIC)

The set of elements that formulate a RIC-Request is optionally present in a Reassociation Request frame if:
- dot11FastBSSTransitionActivated is true,
- The FT Resource Request Protocol is not used,
- The frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true), and
- Either dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3 or 00-0F-AC:4 (i.e., part of a fast BSS transition in an RSN) or dot11RSNAActivated is false (i.e., not in an RSN).

15 Supported Operating Classes

The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.

16 HT Capabilities

The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.

17 20/40 BSS Coexistence

The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.

18 Extended Capabilities

The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.

19 QoS Traffic Capability

The QoS Traffic Capability element is present if dot11MgmtOptionQoSTrafficCapabilityActivated is true.

20 TIM Broadcast Request

The TIM Broadcast Request element is present if dot11MgmtOptionTIMBroadcastActivated is true.

21 FMS Request

The FMS Request element may be present if dot11MgmtOptionFMSActivated is true.

22 DMS Request

The DMS Request element may be present if dot11MgmtOptionDMSActivated is true.

23 Interworking

The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 10.3.5).

Last Vendor Specific

One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.11 Authentication frame format

The frame body of a management frame of subtype Authentication contains the information shown in Table 8-28. FT authentication is used when FT support is advertised by the AP and dot11FastBSSTransitionActivated is true in the STA. SAE authentication is used when dot11MeshActiveAuthenticationProtocol is sae (1).

8.3.3.12 Deauthentication

The frame body of a management frame of subtype Deauthentication contains the information shown in Table 8-30.

Table 8-30—Deauthentication frame body

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Reason code</td>
</tr>
<tr>
<td>2 – (Last – 1)</td>
<td>One or more vendor-specific elements are optionally present.</td>
</tr>
<tr>
<td>Last</td>
<td>The Management MIC element (MME) is present when management frame protection is enabled at the AP and the frame is a group addressed frame.</td>
</tr>
</tbody>
</table>

NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 11.4.4.

8.3.3.13 Action frame format

The frame body of a management frame of subtype Action contains the information shown in Table 8-31.

Table 8-31—Action frame body

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>
<td>2 – (Last – 1)</td>
<td>One or more vendor-specific elements are optionally present.</td>
</tr>
<tr>
<td></td>
<td>These elements are absent when the Category subfield of the Action field is Vendor-Specific, Vendor-Specific Protected, or Self-protected.</td>
</tr>
<tr>
<td>Last</td>
<td>The Management MIC element (MME) is present when management frame protection is enabled at the AP, the frame is a group addressed robust Action frame, and the category of the action frame does not receive privacy as indicated by Table 8-38.</td>
</tr>
</tbody>
</table>

NOTE—The MME appears after any fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 11.4.4.

8.3.3.14 Action No Ack frame format

The frame body of a management frame of subtype Action No Ack contains the information shown in Table 8-32.

Table 8-32—Action No Ack frame body

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>
<td>Last</td>
<td>One or more vendor-specific elements may appear in this frame. This element follows all other elements.</td>
</tr>
</tbody>
</table>
NOTE—The selection of Action or Action No Ack is made per frame that uses these formats.

Unless specified as allowing the use of the Action No Ack management frame subtype, a frame described as an “Action frame” uses only the Action subtype.

8.3.3.15 Timing Advertisement frame format

The frame body of a management frame of subtype Timing Advertisement contains the information shown in Table 8-33.

<table>
<thead>
<tr>

</tbody>
</table>

8.4 Management frame body components

8.4.1 Fields that are not information elements

8.4.1.1 Authentication Algorithm Number field

The Authentication Algorithm Number field indicates a single authentication algorithm. The length of the Authentication Algorithm Number field is 2 octets. The Authentication Algorithm Number field is illustrated in Figure 8-35. The following values are defined for authentication algorithm number:

- Authentication algorithm number = 0: Open System
- Authentication algorithm number = 1: Shared Key
- Authentication algorithm number = 2: Fast BSS Transition
- Authentication algorithm number = 3: simultaneous authentication of equals (SAE)
- Authentication algorithm number = 65 535: Vendor specific use

NOTE—The use of this value implies that a Vendor Specific element is included with more information.

All other values of authentication algorithm number are reserved.

![Authentication Algorithm Number field](image-url)
8.4.1.2 Authentication Transaction Sequence Number field

The Authentication Transaction Sequence Number field indicates the current state of progress through a multistep transaction. The length of the Authentication Transaction Sequence Number field is 2 octets. The Authentication Transaction Sequence Number field is illustrated in Figure 8-36.

![Authentication Transaction Sequence Number](image1)

**Figure 8-36—Authentication Transaction Sequence Number field**

8.4.1.3 Beacon Interval field

The Beacon Interval field represents the number of time units (TUs) between target beacon transmission times (TBTTs). The length of the Beacon Interval field is 2 octets. The Beacon Interval field is illustrated in Figure 8-37.

![Beacon Interval](image2)

**Figure 8-37—Beacon Interval field**

8.4.1.4 Capability Information field

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

The length of the Capability Information field is 2 octets. The format of the Capability Information field is defined in Figure 8-38. No subfield is supplied for ERP as a STA supports ERP operation if it includes all of the Clause 19 mandatory rates in its supported rate set.

![Capability Information](image3)

**Figure 8-38—Capability Information field**

Each Capability Information subfield is interpreted according to the management frame subtype, as defined in this subclause.

An AP sets the ESS subfield to 1 and the IBSS subfield to 0 within transmitted Beacon or Probe Response management frames. A STA within an IBSS sets the ESS subfield to 0 and the IBSS subfield to 1 in transmitted Beacon or Probe Response management frames. A mesh STA sets the ESS and IBSS subfields to 0 in transmitted Beacon or Probe Response management frames.
A non-AP STA sets the QoS, CF-Pollable, and CF-Poll Request subfields in Association and Reassociation Request management frames according to Table 8-34. A mesh STA sets the CF-Pollable and CF-Poll Request subfields to 0.

### Table 8-34—Non-AP STA usage of QoS, CF-Pollable, and CF-Poll Request

</tr>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

An AP sets the CF-Pollable and CF-Poll Request subfields in Beacon and Probe Response management frames according to Table 8-35. A non-QoS AP sets the CF-Pollable and CF-Poll Request subfield values in Association Response and Reassociation Response management frames equal to the values in the last Beacon or Probe Response frame that it transmitted.

### Table 8-35—AP usage of QoS, CF-Pollable, and CF-Poll Request

<td>1</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

An AP sets the Privacy subfield to 1 within transmitted Beacon, Probe Response, Association Response, and Reassociation Response management frames if data confidentiality is required for all data frames exchanged within the BSS. If data confidentiality is not required, the Privacy subfield is set to 0.
In an RSNA, a non-AP STA in an ESS sets the Privacy subfield to 0 within transmitted Association and Reassociation Request management frames. An AP ignores the Privacy subfield within received Association and Reassociation Request management frames.

A STA within an ESS sets the Privacy subfield to 1 in DLS Request and DLS Response frames if encryption is required for all data frames exchanged. If encryption is not required, the Privacy subfield is set to 0.

A STA within an IBSS sets the Privacy subfield to 1 in transmitted Beacon or Probe Response management frames if data confidentiality is required for all data frames exchanged within the IBSS. If data confidentiality is not required, a STA in an IBSS sets the Privacy subfield to 0 within these management frames.

A mesh STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response management frames if data confidentiality is required for all data frames exchanged within the MBSS. If data confidentiality is not required, a mesh STA sets the Privacy subfield to 0 within these management frames.

A STA that includes the RSNE in Beacon and Probe Response frames sets the Privacy subfield to 1 in any frame that includes the RSNE.

An AP sets the Short Preamble subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate that the use of the short preamble, as described in 17.2.2.3, is allowed within this BSS; a STA in an IBSS sets the Short Preamble subfield to 1 in transmitted Beacon when dot11ShortPreambleOptionImplemented is true. Otherwise an AP or a STA in an IBSS sets the Short Preamble subfield to 0.

A mesh STA sets the Short Preamble subfield to 1 when dot11ShortPreambleOptionImplemented is true. Otherwise, a mesh STA sets the Short Preamble subfield to 0.

An ERP STA sets dot11ShortPreambleOptionImplemented to true as all ERP devices support both long and short preamble formats.

A STA sets the Short Preamble subfield to 1 in transmitted Association Request and Reassociation Request management frames and in DLS Request and DLS Response frames when dot11ShortPreambleOptionImplemented is true. Otherwise, a STA sets the Short Preamble subfield to 0.

An AP sets the PBCC subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response management frames to indicate that the packet binary convolutional code (PBCC) modulation option, as described in 17.4.6.7 and 19.6, is allowed within this BSS; a STA in an IBSS sets the PBCC subfield to 1 in transmitted Beacon frames when dot11PBCCOptionImplemented is true. Otherwise an AP or a STA in an IBSS sets the PBCC subfield to 0.

A non-AP STA sets the PBCC subfield to 1 in transmitted Probe Response, Association Request, Reassociation Request, DLS Request, and DLS Response frames when dot11PBCCOptionImplemented is true. Otherwise, a STA sets the PBCC subfield to 0.

The use of the ERP-PBCC option is deprecated, and this option may be removed in a later revision of the standard.

Bit 7 of the Capabilities Information field is used to indicate Channel Agility capability by the High Rate direct sequence spread spectrum (HR/DSSS) PHY or ERP. A STA sets the Channel Agility bit to 1 when Channel Agility is in use and sets it to 0 otherwise.

A STA sets the Spectrum Management subfield in the Capability Information field to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.
A STA sets the QoS subfield to 1 within the Capability Information field when dot11QosOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Short Slot Time subfield to 1 in transmitted Association Request, Reassociation Request, DLS Request, and DLS Response MMPDUs when dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the STA sets the Short Slot Time subfield to 0 in transmitted Association Request and Reassociation Request MMPDUs.

An AP sets the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate the currently used slot time value within this BSS. See 10.1.3.2.

See 9.3.2.12 for the operation of aSlotTime.

For IBSS and MBSS, the Short Slot Time subfield is set to 0.

An AP sets the APSD subfield to 1 within the Capability Information field when dot11APSDOptionImplemented is true and sets it to 0 otherwise. A non-AP STA always sets this subfield to 0.

An AP sets the DSSS-OFDM subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate that the use of direct sequence spread spectrum with orthogonal frequency division multiplexing (DSSS-OFDM), as described in 19.7, is allowed within this BSS. To indicate that the use of DSSS-OFDM is not allowed, the DSSS-OFDM subfield is set to 0 in Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs transmitted within the BSS.

A STA sets the DSSS-OFDM subfield to 1 in transmitted Association Request, Reassociation Request, DLS Request, and DLS Response MMPDUs when dot11DSSSOFDMOptionImplemented and dot11DSSSOFDMOptionActivated are true. Otherwise, a STA sets the DSSS-OFDM subfield to 0 in transmitted Association Request and Reassociation Request MMPDUs.

A STA in an IBSS sets the DSSS-OFDM subfield to 1 in transmitted Beacon and Probe Response MMPDUs when dot11DSSSOFDMOptionImplemented and dot11DSSSOFDMOptionActivated are true. Otherwise, a STA in an IBSS sets the DSSS-OFDM subfield to 0.

The use of the DSSS-OFDM option is deprecated, and this option may be removed in a later revision of the standard.

A STA sets the Delayed Block Ack subfield to 1 within the Capability Information field when dot11DelayedBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Immediate Block Ack subfield to 1 within the Capability Information field when dot11ImmediateBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Radio Measurement subfield in the Capability Information field to 1 when dot11RadioMeasurementActivated is true and sets it to 0 otherwise.

**8.4.1.5 Current AP Address field**

The Current AP Address field is the MAC address of the AP with which the STA is currently associated. The length of the Current AP Address field is 6 octets. The Current AP Address field is illustrated in Figure 8-39.
8.4.1.6 Listen Interval field

The Listen Interval field is used to indicate to the AP how often a STA in power save mode wakes to listen to Beacon management frames. The value of this parameter is the Listen Interval parameter of the MLME-ASSOCIATE.request or MLME-REASSOCIATE.request primitive and is expressed in units of Beacon Interval. The length of the Listen Interval field is 2 octets. The Listen Interval field is illustrated in Figure 8-40.

NOTE—The value 0 might be used by a STA that never enters power save mode.

8.4.1.7 Reason Code field

This Reason Code field is used to indicate the reason that an unsolicited notification management frame of type Disassociation, Deauthentication, DELTS, DELBA, DLS Teardown, or Mesh Peering Close was generated. It is contained in the Mesh Channel Switch Parameters element to indicate the reason for the channel switch. It is contained in the PERR element to indicate the reason for the path error. The length of the Reason Code field is 2 octets. The Reason Code field is illustrated in Figure 8-41.

The reason codes are defined in Table 8-36.

<table>

| 59          | MESH-INCONSISTENT-PARAMETERS | The mesh STA receives inconsistent information about the mesh parameters between Mesh Peering Management frames |
8.4.1.8 AID field

In infrastructure BSS operation, the AID field is a value assigned by an AP during association that represents the 16-bit ID of a STA. In mesh BSS operation, the AID field is a value that represents the 16-bit ID of a neighbor peer mesh STA. An AID value is assigned by a mesh STA that receives and accepts a Mesh Peering Open frame to the transmitter of the Mesh Peering Open frame during the mesh peering establishment process (see 13.3.1). The length of the AID field is 2 octets. The AID field is illustrated in Figure 8-42.

8.4.1.9 Status Code field

The Status Code field is used in a response management frame to indicate the success or failure of a requested operation. The length of the Status Code field is 2 octets. The Status Code field is illustrated in Figure 8-43.
If an operation is successful, then the status code is set to 0. If an operation results in failure, the status code indicates a failure cause. The failure cause codes are defined in Table 8-37.

8.4.1.11 Action field

The Action field provides a mechanism for specifying extended management actions. The format of the Action field is shown in Figure 8-45.

![Action](image)
The Category field is set to one of the nonreserved values shown in Table 8-38. Action frames of a given category are referred to as `<category name> Action frames`. For example, frames in the QoS category are called QoS Action frames.

The Action Details field contains the details of the action. The details of the actions allowed in each category are described in the appropriate subclause referenced in Table 8-38.

</table>

**NOTE**—TDLS Action fields are always transported encapsulated within a data frame (see 10.22.1), so the question of whether these frame are Robust is not applicable.
8.4.1.12 Dialog Token field

The Dialog Token field is used for matching action responses with action requests when there are multiple, concurrent action requests. The length of the Dialog Token field is 1 octet. The Dialog Token field is illustrated in Figure 8-46. See 9.24.5.

![Dialog Token](image1.png)

Figure 8-46—Dialog Token fixed field

8.4.1.13 DLS Timeout Value field

The DLS Timeout Value field is used in the DLS Request frame to indicate the timeout value for the direct link. The length of the DLS Timeout Value field is 2 octets. The DLS Timeout Value field is illustrated in Figure 8-47. See 10.7.2.4.

![DLS Timeout Value](image2.png)

Figure 8-47—DLS Timeout Value fixed field

8.4.1.14 Block Ack Parameter Set field

The Block Ack Parameter Set field is used in ADDBA frames to signal the parameters for setting up a Block Ack. The length of the Block Ack Parameter Set field is 2 octets. The Block Ack Parameter Set field is illustrated in Figure 8-48.

![Block Ack Parameter Set](image3.png)

Figure 8-48—Block Ack Parameter Set fixed field

The A-MSDU Supported subfield determines whether an A-MSDU may be carried in a QoS data MPDU sent under this Block Ack agreement. When equal to 1, use of A-MSDU is permitted. When equal to 0, use of A-MSDU is not permitted.

The Block Ack Policy subfield is set to 1 for immediate Block Ack and 0 for delayed Block Ack.

The TID subfield contains the value of the TC or TS for which the BlockAck is being requested.

The Buffer Size subfield indicates the number of buffers available for this particular TID. When the A-MSDU Supported field is equal to 0 as indicated by the STA transmitting the Block Ack Parameter Set field, each buffer is capable of holding a number of octets equal to the maximum size of an MSDU. When the

---

21For buffer size, the recipient of data advertises a single scalar number that is the number of fragment buffers of the maximum MSDU or A-MSDU size (indicated by the A-MSDU Supported field) available for the Block Ack agreement that is being negotiated. Every buffered MPDU that is associated with this Block Ack agreement consumes one of these buffers regardless of whether the frame contains a whole MSDU (or a fragment thereof) or an A-MSDU. For example, ten maximum-size unfragmented MSDUs consumes the same amount of buffer space at the recipient as ten smaller fragments of a single MSDU of maximum size.
A-MSDU Supported field is equal to 1 as indicated by the STA, each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an ADDBA Request frame, the Buffer Size subfield is intended to provide guidance for the frame receiver to decide its reordering buffer size and is advisory only. If the Buffer Size subfield is equal to 0, it implies that the originator of the Block Ack has no information to specify its value.

In an ADDBA Response frame, when the Status Code field is equal to 0, the Buffer Size subfield is set to a value of at least 1.

### 8.4.1.15 Block Ack Timeout Value field

The Block Ack Timeout Value field is used in the ADDBA Request and Response frames to indicate the timeout value for Block Ack. The length of the Block Ack Timeout Value field is 2 octets. The Block Ack Timeout Value field is illustrated in Figure 8-49.

![Block Ack Timeout Value fixed field](image)

The Block Ack Timeout Value field contains the duration, in TUs, after which the Block Ack setup is terminated, if there are no frame exchanges (see 10.5.4) within this duration using this Block Ack agreement. A value of 0 disables the timeout.

### 8.4.1.16 DELBA Parameter Set field

The DELBA Parameter Set field is used in a DELBA frame to terminate an already setup Block Ack. The length of the DELBA Parameters field is 2 octets. The DELBA Parameters field is illustrated in Figure 8-50.

![DELBA Parameters fixed field](image)

The Initiator subfield indicates if the originator or the recipient of the data is sending this frame. It is set to 1 to indicate the originator and is set to 0 to indicate the recipient. The TID subfield indicates the TSID or the UP for which the Block Ack has been originally set up.

### 8.4.1.17 QoS Info field

The QoS Info field is 1 octet in length and contains capability information bits. The contents of the field are dependent on whether the STA is contained within an AP.

The format of the QoS Info field, when sent by the AP, is defined in Figure 8-51.
The EDCA Parameter Set Update Count subfield is described in 9.2.4.2.

APs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

APs set the Queue Request subfield to 1 if they can process a nonzero Queue Size subfield in the QoS Control field in QoS data frames and set it to 0 otherwise.

APs set the TXOP Request subfield to 1 if they can process a nonzero TXOP Duration Requested subfield in the QoS Control field in QoS data frames and set it to 0 otherwise.

The format of the QoS Info field, when sent by the non-AP STA, is defined in Figure 8-52.

Each of the ACs U-APSD Flag subfields is 1 bit in length and set to 1 in (Re)Association Request frames to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is both trigger-enabled and delivery-enabled. It is set to 0 in (Re)Association Request frames to indicate that the corresponding AC is neither trigger-enabled nor delivery-enabled. A TSPEC as described in 10.2.1.5 is to be used to make a particular AC exclusively either trigger-enabled or delivery-enabled. These subfields are set to 0 when the APSD subfield in the Capability Information field is equal to 0.

Non-AP STAs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

The Max SP Length subfield is 2 bits in length and indicates the maximum number of total buffered MSDUs, A-MSDUs, and MMPDUs the AP may deliver to a STA during any SP triggered by the STA. This subfield is reserved when the APSD subfield in the Capability Information field is equal to 0. If the APSD subfield in the Capability Information field is equal to 1, the settings of the values in the Max SP Length subfield are defined in Table 8-39.

<table>
<thead>
<tr>
<th>Bit 5</th>
<th>Bit 6</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>AP may deliver all buffered MSDUs, A-MSDUs, and MMPDUs.</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>AP may deliver a maximum of two MSDUs, A-MSDUs, and MMPDUs per SP.</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>AP may deliver a maximum of four MSDUs, A-MSDUs, and MMPDUs per SP.</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>AP may deliver a maximum of six MSDUs, A-MSDUs, and MMPDUs per SP.</td>
</tr>
</tbody>
</table>
Non-AP STAs set the More Data Ack subfield to 1 to indicate that they can process ACK frames with the More Data bit in the Frame Control field equal to 1 and remain in the Awake state. Non-AP STAs set the More Data Ack subfield to 0 otherwise. For APs, the More Data Ack subfield is reserved.

8.4.1.18 Measurement Pilot Interval field

The Measurement Pilot Interval field represents the number of time units (TUs) between target measurement pilot transmission times (TMPTTs). The length of the Measurement Pilot Interval field is 1 octet. The Measurement Pilot Interval field is illustrated in Figure 8-53.

![Figure 8-53—Measurement Pilot Interval fixed field](image1)

8.4.1.19 Max Transmit Power field

The Max Transmit Power field is a twos complement signed integer and is 1 octet in length, providing an upper limit, in units of dBm, on the transmit power as measured at the output of the antenna connector to be used by that AP on the current channel. See 10.11.13. The Max Transmit Power field is illustrated in Figure 8-54.

![Figure 8-54—Max Transmit Power field](image2)

8.4.1.20 Transmit Power Used field

The Transmit Power Used field is a twos complement signed integer and is 1 octet in length. It is less than or equal to the Max Transmit Power and indicates the actual power used as measured at the output of the antenna connector, in units of dBm, by a STA when transmitting the frame containing the Transmit Power Used field. The Transmit Power Used value is determined anytime prior to sending the frame in which it is contained and has a tolerance of ±5 dB. The Transmit Power Used field is illustrated in Figure 8-55.

![Figure 8-55—Transmit Power Used field](image3)
8.4.1.21 Channel Width field

The Channel Width field is used in a Notify Channel Width frame (see 8.5.12.2) to indicate the channel width on which the sending STA is able to receive. The length of the field is 1 octet. The Channel Width field is illustrated in Figure 8-56.

![Figure 8-56—Channel Width fixed field](image)

If a STA transmitting or receiving this field is operating in an operating class that includes a value of 13 or 14 in the behavior limits as specified in Annex E, then the values of the Channel Width field are defined in Table 8-40. If a STA transmitting or receiving this field is operating in an operating class that does not include a value of 13 or 14 in the behavior limits as specified in Annex E, then this field is reserved.

<table>

</tr>
</tbody>
</table>

Table 8-40—Settings of the Channel Width field

8.4.1.22 SM Power Control field

The SM Power Control field is used in an SM Power Save frame (see 8.5.12.3) by a STA to communicate changes in its SM power-saving state. The field is 1 octet in length and is illustrated in Figure 8-57.

![Figure 8-57—SM Power Control fixed field](image)

The SM Power Save Enabled subfield indicates whether SM power saving is enabled at the STA. A value of 1 indicates enabled, and a value of 0 indicates disabled.

The SM Mode subfield indicates the mode of operation. A value of 1 indicates dynamic SM power save mode, a value of 0 indicates static SM power save mode. The modes are described in 10.2.4.

8.4.1.23 PCO Phase Control field

The PCO Phase Control field is used in a Set PCO Phase frame (see 8.5.12.5) to indicate the phase of PCO operation (see 10.16). The length of the field is 1 octet. The PCO Phase Control field is illustrated in Figure 8-58.
The PCO Phase Control field indicates the current PCO phase. The values of the PCO Phase Control field are defined in Table 8-41.

### Table 8-41—Settings of the PCO Phase Control field

<table>
<thead>
<tr>

#### 8.4.1.24 PSMP Parameter Set field

The PSMP Parameter Set field is used in a PSMP frame (see 8.5.12.4) to define the number of PSMP STA Info fields held in the PSMP frame, to indicate whether the PSMP sequence is to be followed by another PSMP sequence, and to indicate the duration of the PSMP sequence.

The PSMP Parameter Set field is 2 octets in length. The structure of the PSMP Parameter Set field is defined in Figure 8-59.

### Figure 8-59—PSMP Parameter Set fixed field

<table>
<thead>
<tr>
<th>B0</th>
<th>B4</th>
<th>B5</th>
<th>B6</th>
<th>B15</th>
</tr>
</thead>
<tbody>
<tr>
<td>N_STA</td>

<td>PSMP Sequence Duration</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Bits:</td>
<td>5</td>
<td>6</td>
<td>10</td>
<td></td>
</tr>
</tbody>
</table>

The N_STA subfield indicates the number of STA Info fields present in the PSMP frame that contains the PSMP Parameter Set field.

The More PSMP subfield, when set to 1, indicates that the current PSMP sequence will be followed by another PSMP sequence. A value of 0 indicates that there will be no PSMP sequence following the current PSMP sequence.

The PSMP Sequence Duration subfield indicates the duration of the current PSMP sequence that is described by the PSMP frame, in units of 8 µs, relative to the end of the PSMP frame. Therefore, this field can describe a PSMP sequence with a duration of up to 8.184 ms. The next PSMP sequence within the current PSMP burst starts a SIFS interval after the indicated duration.

#### 8.4.1.25 PSMP STA Info field

The PSMP STA Info field is used by the PSMP frame (see 8.5.12.4). The PSMP STA Info field defines the allocation of time to the downlink (PSMP-DTT) and/or uplink (PSMP-UTT) associated with a single RA.
There are two variants of the structure for the individually addressed and group addressed cases. The length of the PSMP STA Info field is 8 octets.

The structure of the STA Info field is defined in Figure 8-60 and Figure 8-61.

![Figure 8-60—PSMP STA Info fixed field (group addressed)](image)

![Figure 8-61—PSMP STA Info fixed field (individually addressed)](image)

The STA_INFO Type subfield indicates the format of the remainder of the structure. When the STA_INFO Type subfield is equal to 1, the PSMP STA Info field is structured as defined in Figure 8-60 and supports the transmission of group addressed data by the AP. When the STA_INFO Type subfield is equal to 2, the PSMP STA Info field is structured as defined in Figure 8-61 and supports the exchange of data with a single STA. STA_INFO Type subfield values 0 and 3 are reserved.

The PSMP-DTT Start Offset subfield indicates the start of the PSMP-DTT for the destination identified by the PSMP STA Info field, relative to the end of the PSMP frame, in units of 4 µs. This subfield locates the start of the first PPDU containing downlink data for this destination.

The PSMP-DTT Duration subfield indicates the duration of the PSMP-DTT for the destination identified by the PSMP STA Info field, in units of 16 µs. This subfield locates the end of the last PPDU containing downlink data for this destination relative to the PDMP-DTT start offset.

If no PSMP-DTT is scheduled for a STA, but a PSMP-UTT is scheduled for that STA, the PSMP-DTT Duration subfield is set to 0, and the PSMP-DTT Start Offset subfield is reserved.

The PSMP Group Address ID (B21 to B63) subfield contains the 43 least significant bits (LSBs) of a 48 bit MAC address. Use of this subfield is described in 9.26.1.8. B63 contains the LSB of the group address (considering the Individual/Group bit to be the most significant bit (MSB)).

The STA_ID subfield contains the AID of the STA to which the PSMP STA Info field is directed.

The PSMP-UTT Start Offset subfield indicates the start of the PSMP-UTT. The offset is specified relative to the end of the PSMP frame. It is specified in units of 4 µs. The first PSMP-UTT is scheduled to begin after a SIFS interval from the end of the last PSMP-DTT described in the PSMP.

The PSMP-UTT Duration subfield indicates the maximum length of a PSMP-UTT for a STA. PSMP-UTT duration is specified in units of 4 µs. All transmissions by the STA within the current PSMP sequence lie within the indicated PSMP-UTT.
If no PSMP-UTT is scheduled for a STA, but a PSMP-DTT is scheduled for that STA, the PSMP-UTT Start Offset and PSMP-UTT Duration subfields are both set to 0.

### 8.4.1.26 MIMO Control field

The MIMO Control field is used to manage the exchange of MIMO channel state or transmit beamforming feedback information. It is used in the CSI (see 8.5.12.6), Noncompressed Beamforming (see 8.5.12.7), and Compressed Beamforming (see 8.5.12.8) frames.

The MIMO Control field is 6 octets in length and is defined in Figure 8-62.

![Figure 8-62—MIMO Control field](image)

The subfields of the MIMO Control field are defined in Table 8-42.

### Table 8-42—Subfields of the MIMO Control field

</tbody>
</table>
8.4.1.27 CSI Report field

The CSI Report field is used by the CSI frame (see 8.5.12.6) to carry explicit channel state information to a transmit beamformer, as described in 9.29.3.

The CSI Matrix subfields in the CSI Report field shown in Table 8-43 and Table 8-44 are matrices whose elements are taken from the CHAN_MAT parameter of RXVECTOR (see Table 20-1).

### Table 8-43—CSI Report field (20 MHz)

<table>
<thead>
<tr>
<th>Field</th>
<th>Size (bits)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

<td>(3+2 \times Nb \times Nc \times N_r)</td>
<td>CSI matrix (see Figure 8-63)</td>
</tr>
</tbody>
</table>
The structure of the field depends on the value of the MIMO Control Channel Width subfield. The CSI Report field for 20 MHz has the structure defined in Table 8-43 where

\( Nb \) is the number of bits determined by the Coefficients Size field of the MIMO Control field

\( Nc \) is the number of columns in a CSI matrix determined by the Nc Index field of the MIMO Control field

\( Nr \) is the number of rows in a CSI matrix determined by the Nr Index field of the MIMO Control field

The CSI Report field for 40 MHz has the structure defined in Table 8-44.

<table>
<thead>
<tr>
<th>Field</th>
<th>Size (bits)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSI Matrix for carrier –1</td>
<td>3 + 2 \times Nb \times Nc \times Nr</td>

<td>CSI matrix</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CSI Matrix for carrier 28</td>
<td>3 + 2 \times Nb \times Nc \times Nr</td>
<td>CSI matrix</td>
</tr>
</tbody>
</table>

The signal-to-noise ratio (SNR) values in Table 8-43 and Table 8-44 are encoded as an 8-bit twos complement value of \( 4 \times (\text{SNR} \_\text{average} – 22) \), where \( \text{SNR} \_\text{average} \) is the decibel representation of linearly averaged values over the tones represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps.

Grouping is a method that reduces the size of the CSI Report field by reporting a single value for each group of \( Ng \) adjacent subcarriers. With grouping, the size of the CSI Report field is \( Nr \times 8 + Ns \times (3 + 2 \times Nb \times Nc \times Nr) \) bits, where the number of subcarriers sent, \( Ns \), is a function of \( Ng \) and whether matrices for 40 MHz or 20 MHz are sent. The value of \( Ns \) and the specific carriers for which matrices are sent are shown in Table 8-45. If the size of the CSI Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.
The CSI matrix $H_{\text{eff}}$ for a single carrier has the structure defined in Figure 8-63. The encoding rules for the elements of the $H_{\text{eff}}$ matrix are given in 20.3.12.3.2.

For each subcarrier include

```
  Carrier Matrix Amplitude of 3 bits
  For each of Nr rows in each CSI matrix in order: (1, ..., Nr)
  {
    Include Nc complex coefficients of CSI matrix $H_{\text{eff}}$ in order: (1, ..., Nc);
    each element of $H_{\text{eff}}$ includes the real part of the element (Nb bits) and 
    imaginary part of the element (Nb bits) in that order
  }
```

**Figure 8-63—CSI matrix coding**

When operating with a 40 MHz channel width, CSI feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

### 8.4.1.28 Noncompressed Beamforming Report field

The Noncompressed Beamforming Report field is used by the Noncompressed Beamforming frame to carry explicit feedback in the form of noncompressed beamforming feedback matrices $V$ for use by a transmit beamformer to determine steering matrices $Q$, as described in 9.29.3 and 20.3.12.3.

The structure of the field is dependent on the value of the MIMO Control Channel Width subfield. The Noncompressed Beamforming Report field for 20 MHz has the structure defined in Table 8-46 where

- $Nb$ is the number of bits determined by the Coefficients Size field of the MIMO Control field
- $Nc$ is the number of columns in a beamforming feedback matrix determined by the Nc Index field of the MIMO Control field
- $Nr$ is the number of rows in a beamforming feedback matrix determined by the Nr Index field of the MIMO Control field

</tr>
<tr>
<td>Beamforming Feedback Matrix for carrier 58</td>
<td>(+2 \times Nb \times Nc \times Nr)</td>
<td>Beamforming feedback matrix (V)</td>
</tr>
</tbody>
</table>

The SNR values in Table 8-46 and Table 8-47 are encoded as an 8-bit two’s complement value of \(4 \times (\text{SNR}_{\text{average}} – 22)\), where \(\text{SNR}_{\text{average}}\) is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from \(-10\) dB to 53.75 dB in 0.25 dB steps. The SNR in space-time stream \(i\) corresponds to the SNR associated with the column \(i\) of the beamforming feedback matrix \(V\). Each SNR corresponds to the predicted SNR at beamformee when the beamformer applies the matrix \(V\).
Grouping is a method that reduces the size of the Noncompressed Beamforming Report field by reporting a single value for each group of $N_g$ adjacent subcarriers. With grouping, the size of the Noncompressed Beamforming Report field is $N_c 	imes 8 + N_s 	imes (2 \times N_b \times N_c \times N_r)$ bits. The number of subcarriers sent, $N_s$, is a function of $N_g$ and whether matrices for 40 MHz or 20 MHz are sent. The value of $N_s$ and the specific carriers for which matrices are sent is shown in Table 8-45. If the size of the Noncompressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.

A beamforming feedback matrix $V$ for a single carrier has the structure defined in Figure 8-64.

For each subcarrier include

\[
\text{For each of } N_r \text{ rows in the Noncompressed beamforming feedback matrix in order: } (1, \ldots, N_r)
\]

\[
\text{Include } N_c \text{ complex coefficients of the Noncompressed beamforming feedback matrix } V \text{ in order: } (1, \ldots, N_c) \text{; each element of } V \text{ includes the real part of the element (} N_b \text{ bits) and imaginary part of the element (} N_b \text{ bits) in that order}
\]

\[
\text{Figure 8-64—} V \text{ matrix coding (noncompressed beamforming)}
\]

When operating with a 40 MHz channel width, noncompressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

### 8.4.1.29 Compressed Beamforming Report field

The Compressed Beamforming Report field is used by the Compressed Beamforming frame (see 8.5.12.8) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices $V$ for use by a transmit beamformer to determine steering matrices $Q$, as described in 9.29.3 and 20.3.12.3.

The size of the Compressed Beamforming Report field depends on the values in the MIMO Control field.

The Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 8-48 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix $V$ is given in 20.3.12.3.6.

### Table 8-48—Order of angles in the Compressed Beamforming Report field

<table>
<thead>
<tr>
<th>Size of $V$ ($N_r \times N_c$)</th>
<th>Number of angles ($N_a$)</th>
<th>The order of angles in the Quantized Beamforming Feedback Matrices Information field</th>
</tr>
</thead>

<td>$\phi_{11}, \psi_{21}$</td>
</tr>
<tr>
<td>$3 \times 1$</td>
<td>4</td>
<td>$\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}$</td>
</tr>
</tbody>
</table>
The angles are quantized as defined in Table 8-49. All angles are transmitted LSB to MSB.

The Compressed Beamforming Report field for 20 MHz has the structure defined in Table 8-50, where Na is the number of angles used for beamforming feedback matrix V (see Table 8-48).
The Compressed Beamforming Report field for 40 MHz has the structure defined in Table 8-51, where \( N_a \) is the number of angles used for beamforming feedback matrix \( V \) (see Table 8-48).

### Table 8-51—Compressed Beamforming Report field (40 MHz)

<table>
<thead>
<tr>
<th>Field</th>
<th>Size (bits)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beamforming Feedback Matrix ( V ) for carrier 1</td>
<td>( N_a(a + b)/2 )</td>
<td>Beamforming feedback matrix ( V )</td>

<td></td>
<td></td>
</tr>
<tr>
<td>Beamforming Feedback Matrix ( V ) for carrier 28</td>
<td>( N_a(a + b)/2 )</td>
<td>Beamforming feedback matrix ( V )</td>
</tr>
</tbody>
</table>

The SNR values in Table 8-50 and Table 8-51 are encoded as an 8-bit two's complement value of \( 4 \times (\text{SNR}_{\text{average}} - 22) \), where \( \text{SNR}_{\text{average}} \) is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from \(-10\) dB to \(53.75\) dB in \(0.25\) dB steps. Each SNR value per tone in stream \( i \) (before being averaged) corresponds to the SNR associated with the column \( i \) of the beamforming feedback matrix \( V \) determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies the matrix \( V \).

Grouping is a method that reduces the size of the Compressed Beamforming Report field by reporting a single value for each group of \( N_g \) adjacent subcarriers. With grouping, the size of the Compressed Beamforming Report field is \( N_c \times 8 + N_s \times (N_a(a + b)/2) \) bits, where the number of subcarriers sent, \( N_s \), is a function of \( N_g \) and whether matrices for 40 MHz or 20 MHz are sent. The value of \( N_s \) and the specific carriers for which matrices are sent is defined in Table 8-45. If the size of the Compressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.
When operating with a 40 MHz channel width, compressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

### 8.4.1.30 Antenna Selection Indices field

The Antenna Selection Indices field is used within the Antenna Selection Indices Feedback frame to carry ASEL feedback, as described in 9.30.

The Antenna Selection Indices field is 1 octet in length and illustrated in Figure 8-67.

![Antenna Selection Indices fixed field](image)

Bits 0 to 7 in the Antenna Selection Indices field correspond to antennas with indices 0 to 7, respectively. A value of 1 in a bit indicates the corresponding antenna is selected, and the value of 0 indicates the corresponding antenna is not selected.
### 8.4.1.31 Organization Identifier field

The Organization Identifier field shall contain a public organizationally unique identifier assigned by the IEEE. The order of the Organization Identifier field is described in 8.2.2. The IEEE has assigned public organizationally unique identifiers both of 24-bit length (OUI) and longer length. In the latter case specific OUI values are shared over multiple organizations, e.g., using 36-bit length identifiers (OUI-36 and IAB) (see IEEE Registration Authority [B19]). The length of the Organization Identifier field \( j \) shall be the minimum number of octets required to contain the entire organizationally unique identifier (see Figure 8-68), and the first 3 octets shall contain the OUI portion of the identifier. Thus, the Organization Identifier field is 3 octets in length if the organizationally unique identifier is an OUI, or 5 octets in length if the organizationally unique identifier is 36 bits in length. The IEEE assigns 36-bit organizationally unique identifiers such that the OUI portion indicates that total length of the identifier is 36 bits.

![Figure 8-68—Organization Identifier field](image)

If the length of the organizationally unique identifier is not an integral number of octets, the least significant bits of the last octet are specified by the organization identified.

**NOTE**—For example, for the organizationally unique identifier 0x0050C24A4, the Organization Identifier field would contain 0x0050C24A4\( y \) where \( y \) represents the four least significant bits of the fifth octet of the field. The value of \( y \) is specified by the organization whose identifier is 0x0050C24A4.

### 8.4.1.32 Rate Identification field

The Rate Identification field is 4 octets in length and contains the rate identification information for a frame that is not the current frame transmitted or received by a STA. This information allows services to exchange frame rate information prior to use of the frames that use the rate specified by the Rate Identification field. The contents of the field is defined in Figure 8-69.

![Figure 8-69—Identification field format](image)

The Mask field specifies which other fields in the Rate Identification field are used by a STA. The format of the Mask field is shown in Figure 8-70.

![Figure 8-70—Mask field format](image)

The MCS Selector field set to 0 indicates the MCS Index field is reserved. The MCS Selector field set to 1 indicates the MCS Index field specifies an index value that is taken from Table 20-30 through Table 20-33 and Table 20-39 through Table 20-41 in 20.6. The MCS Selector field set to 2 indicates the MCS Index field specifies an index value that is taken from Table 20-34 through Table 20-38 and Table 20-43 through Table 20-44 in 20.6. The MCS Selector field values 3 to 7 are reserved.

Copyright © 2012 IEEE. All rights reserved.
The Rate Type field set to 0 indicates the Rate field is reserved. The Rate Type field set to 1 indicates the Rate field specifies a data rate that is in the basic rate set. The Rate Type field set to 2 indicates the Rate field specifies a data rate that is not in the basic rate set.

The MCS Index field is a 1 octet unsigned integer that specifies the row index for one of the MCS parameter tables in 20.6.

The Rate field contains a 2-octet unsigned integer that specifies the PHY rate in 0.5 Mb/s units.

### 8.4.1.33 GAS Query Response Fragment ID field

A GAS Query Fragment Response ID field is used by the STA to indicate when a GAS Query Response spans multiple MMPDUs. STAs responding to GAS request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response. Requesting STAs use this field to determine if any fragments of the Query Response are missing. The maximum value permitted in the GAS Query Response Fragment ID is 127. The More GAS Fragments field is set to 1 in GAS Query Response fragments of GAS Comeback Response frames that have another GAS fragment of the current query response to follow; otherwise, it is set to 0. The format of GAS Query Response Fragment ID is shown in Figure 8-71.

![Figure 8-71—GAS Query Response Fragment ID field](image)

### 8.4.1.34 Venue Info field

The Venue Info field is a 2-octet field. It contains Venue Group and Venue Type subfields. The format of Venue Info subfield is shown in Figure 8-72.

![Figure 8-72—Venue Info field format](image)
The Venue Group and Venue Type subfields are both 1-octet values selected from Table 8-52 and Table 8-53, respectively. The entries in Table 8-52 and Table 8-53 are drawn from the International Building Code’s Use and Occupancy Classifications [B43].

**Figure 8-73—Target Channel field format**

8.4.1.36 Operating Class

The Operating Class field specifies the operating class for the channel field included in the same frame. The length of the Operating Class field is 1 octet. Operating classes are defined in Annex E. The Operating Class
field is illustrated in Figure 8-74.

![Operating Class diagram](image)

**Figure 8-74—Operating Channel field format**

8.4.1.37 Send-Confirm field

The Send-Confirm field is used with SAE authentication as an anti-replay counter as specified in 11.3. See Figure 8-75.

![Send-Confirm diagram](image)

**Figure 8-75—Send-Confirm field**

8.4.1.38 Anti-Clogging Token field

The Anti-Clogging Token field is used with SAE authentication for denial-of-service protection as specified in 11.3. See Figure 8-76.

![Anti-Clogging Token diagram](image)

**Figure 8-76—Anti-Clogging Token field**

8.4.1.39 Scalar field

The Scalar field is used with SAE authentication to communicate cryptographic material as specified in 11.3. See Figure 8-77.

![Scalar diagram](image)

**Figure 8-77—Scalar field**

8.4.1.40 Element field

The Element field is used with SAE authentication to communicate an element in a finite field as specified in 11.3. See Figure 8-78.

![Element diagram](image)

**Figure 8-78—Element field**
8.4.1.41 Confirm field

The Confirm field is used with SAE authentication to authenticate and prove possession of a cryptographic key as specified in 11.3. See Figure 8-79.

8.4.2 Information elements

8.4.2.1 General

Elements are defined to have a common general format consisting of a 1 octet Element ID field, a 1 octet Length field, and a variable-length element-specific Information field. Each element is assigned a unique Element ID as defined in this standard. The Length field specifies the number of octets in the Information field. See Figure 8-81.

<table>
<thead>
<tr>

Copyright © 2012 IEEE. All rights reserved.
The frame body components specified for many management subtypes result in elements ordered by ascending Element ID, with the exception of the MIC Management element (8.4.2.57). If present, the MIC Management element appears at the end of the robust management frame body. See 9.24.6 on the parsing of elements.

A “Yes” in the Extensible column of an element listed in Table 8-54 indicates that the Length of the element might be extended in future revisions or amendments of this standard. See 9.24.8. When the Extensible column of an element is set to “Subelements,” then the element might be extended in future revisions or amendments of this standard by defining additional subelements. See 9.24.9.

### 8.4.2.2 SSID element

The SSID element indicates the identity of an ESS or IBSS. See Figure 8-82.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>SSID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>0–32</td>
</tr>
</tbody>
</table>

**Figure 8-82—SSID element format**

The length of the SSID field is between 0 and 32 octets. A SSID field of length 0 is used within Probe Request management frames to indicate the wildcard SSID. The wildcard SSID is also used in Beacon and Probe Response frames transmitted by mesh STAs.

When the UTF-8 SSID subfield of the Extended Capabilities element is equal to 1 in the frame that includes the SSID element, the SSID is interpreted using UTF-8 encoding.

NOTE—This is true for Beacon and Probe Response frames when the MLME-START.request primitive was issued with the SSIDEncoding parameter equal to UTF8.

### 8.4.2.3 Supported Rates element

The Supported Rates element specifies up to eight rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives, and zero or more BSS membership selectors. The Information field is encoded as 1 to 8 octets, where each octet describes a single Supported Rate or BSS membership selector (see Figure 8-83).
Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each Supported Rate contained in the BSSBasicRateSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the data rate, if necessary rounded up to the next 500 kb/s, in units of 500 kb/s. For example, a 2.25 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'85'. Rates not contained in the BSSBasicRateSet parameter are encoded with the MSB set to 0, and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04'). The MSB of each Supported Rate octet in other management frame types is ignored by receiving STAs.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 8-55 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF'). A BSS membership selector that has the MSB (bit 7) set to 1 in the Supported Rates element is defined to be basic. The MSB of each Supported Rate octet in other management frame types is ignored by receiving STAs.

The valid values for BSS membership selectors and their associated features are shown in Table 8-55.

NOTE—Because the BSS membership selector and supported rates are carried in the same field, the BSS membership selector value cannot match the value corresponding to any valid supported rate. This allows any value in the supported rates set to be determined as either a supported rate or a BSS membership selector.

</tbody>
</table>

See 10.1.4.6.

8.4.2.4 FH Parameter Set element

The FH Parameter Set element contains the set of parameters necessary to allow synchronization for STAs using an FH PHY. The Information field contains Dwell Time, Hop Set, Hop Pattern, and Hop Index parameters. The total length of the Information field is 5 octets. See Figure 8-84.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Dwell Time (TU)</th>

<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-84—FH Parameter Set element format

The Dwell Time field is 2 octets in length and contains the dwell time (dot11CurrentDwellTime) in TU.
The Hop Set field identifies the current set (dot11CurrentSet) of hop patterns and is a single octet.

The Hop Pattern field identifies the current pattern (dot11CurrentPattern) within a set of hop patterns and is a single octet.

The Hop Index field selects the current index (dot11CurrentIndex) within a pattern and is a single octet.

The description of the attributes used in this subclause is in 14.9.2.

### 8.4.2.5 DSSS Parameter Set element

The DSSS Parameter Set element contains information to allow channel number identification for STAs. The Information field contains a single parameter containing the dot11CurrentChannel (see 16.4.6.3, 17.4.6.3, 18.3.8.4.2 and 20.3.15 for values). The length of the dot11CurrentChannel parameter is 1 octet. See Figure 8-85.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Current Channel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-85—DSSS Parameter Set element format**

### 8.4.2.6 CF Parameter Set element

The CF Parameter Set element contains the set of parameters necessary to support the PCF. The Information field contains the CFPCount, CFPPeriod, CFPMaxDuration, and CFPDurRemaining fields. The total length of the Information field is 6 octets. See Figure 8-86.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>CFP Count</th>
<th>CFP Period</th>
<th>CFP MaxDuration (TU)</th>
<th>CFP DurRemaining (TU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-86—CF Parameter Set element format**

CFPCount indicates how many delivery traffic indication maps (DTIMs) (including the current frame) appear before the next CFP start. A CFPCount of 0 indicates that the current DTIM marks the start of the CFP.

CFPPeriod indicates the number of DTIM intervals between the start of CFPs. The value is an integral number of DTIM intervals.

CFPMaxDuration indicates the maximum duration, in TU, of the CFP that may be generated by this PCF. This value is used by STAs to set their NAV at the TBTT of Beacon frames that begin CFPs.

CFPDurRemaining indicates the maximum time, in TU, remaining in the present CFP, and is set to 0 in CFP Parameter elements of Beacon frames transmitted during the CP. The value of CFPDurRemaining is referenced to the immediately previous TBTT. This value is used by all STAs to update their NAVs during CFPs.

### 8.4.2.7 TIM element

The TIM element contains four fields: DTIM Count, DTIM Period, Bitmap Control, and Partial Virtual Bitmap. See Figure 8-87.
The Length field for this element indicates the length of the Information field, which is constrained as described below.

The DTIM Count field indicates how many Beacon frames (including the current frame) appear before the next DTIM. A DTIM Count of 0 indicates that the current TIM is a DTIM. The DTIM count field is a single octet.

The DTIM Period field indicates the number of beacon intervals between successive DTIMs. If all TIMs are DTIMs, the DTIM Period field has the value 1. The DTIM Period value 0 is reserved. The DTIM period field is a single octet.

The Bitmap Control field is a single octet. Bit 0 of the field contains the Traffic Indicator bit associated with AID 0. This bit is set to 1 in TIM elements with a value of 0 in the DTIM Count field when one or more group addressed MSDUs/MMPDUs are buffered at the AP or the mesh STA. The remaining 7 bits of the field form the Bitmap Offset.

The traffic-indication virtual bitmap, maintained by the AP or the mesh STA that generates a TIM, consists of 2008 bits, and is organized into 251 octets such that bit number \( N \) \((0 \leq N \leq 2007)\) in the bitmap corresponds to bit number \( (N \mod 8) \) in octet number \( \lceil N / 8 \rceil \) where the low-order bit of each octet is bit number 0, and the high order bit is bit number 7. Each bit in the traffic-indication virtual bitmap corresponds to traffic buffered for a specific neighbor peer mesh STA within the MBSS that the mesh STA is prepared to deliver or STA within the BSS that the AP is prepared to deliver at the time the Beacon frame is transmitted. Bit number \( N \) is 0 if there are no individually addressed MSDUs/MMPDUs buffered for the STA whose AID is \( N \). If any individually addressed MSDUs/MMPDUs for that STA are buffered and the AP or the mesh STA is prepared to deliver them, bit number \( N \) in the traffic-indication virtual bitmap is 1. A PC might decline to set bits in the TIM for CF-Pollable STAs it does not intend to poll (see 10.2.1.7).

When dot11MgmtOptionMultiBSSIDActivated is false, the Partial Virtual Bitmap field consists of octets numbered \( N_1 \) to \( N_2 \) of the traffic indication virtual bitmap, where \( N_1 \) is the largest even number such that bits numbered 1 to \( (N_1 \times 8) – 1 \) in the bitmap are all 0 and \( N_2 \) is the smallest number such that bits numbered \( (N_2 + 1) \times 8 \) to 2007 in the bitmap are all 0. In this case, the Bitmap Offset subfield value contains the number \( N_1/2 \), and the Length field is set to \( (N_2 – N_1) + 4 \).

In the event that all bits other than bit 0 in the virtual bitmap are 0, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4.

When dot11MgmtOptionMultiBSSIDActivated is true, the Partial Virtual Bitmap field of the TIM element is constructed as follows, where the maximum possible number of BSSIDs is an integer power of 2, \( n = \log_2 \) (maximum possible number of BSSIDs), \( k \) is the number of actually supported nontransmitted BSSIDs, and \( k \leq (2^n – 1) \).

- The bits 1 to \( k \) of the bitmap are used to indicate that one or more group addressed frames are buffered for each AP corresponding to a nontransmitted BSSID. The AIDs from 1 to \( k \) are not allocated to a STA. The AIDs from \( (k + 1) \) to \( (2^n – 1) \) are reserved and set to 0. The remaining AIDs are shared by the BSSs corresponding to the transmitted BSSID and all nontransmitted BSSIDs.
- When the DTIM Count field is 0 for a BSS that has a nontransmitted BSSID, and one or more group addressed frames are buffered at the AP for this BSS, the corresponding bits from bit 1 to bit \( k \) is set to 1.
— Each bit starting from bit $2^n$ in the traffic-indication virtual bitmap corresponds to individually addressed traffic buffered for a specific STA within any BSS corresponding to a transmitted or nontransmitted BSSID at the time the Beacon frame is transmitted. The correspondence is based on the AID of the STA.

— Based upon its knowledge of the capability of associated stations to support the multiple BSSID capability, as indicated by the corresponding field in the Extended Capabilities element and the content of the traffic indication virtual bitmap, an AP shall encode the Partial Virtual Bitmap and the Bitmap Control field of the TIM element using one of the two following methods. Specifically, an AP uses Method B when it determines that the bit for each associated non-AP STA in the virtual bitmap that is reconstructed by each non-AP STA from the received TIM element encoded using Method B is set correctly. Otherwise, an AP uses Method A.

Method A and Method B are described as follows:

a) Method A: The Partial Virtual Bitmap field consists of octets numbered 0 to $N_2$ of the traffic indication virtual bitmap, where $N_2$ is the smallest number such that bits numbered $(N_2 + 1) \times 8$ to 2007 in the bitmap are all 0. If such a value $N_2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N_2 = 250$. When using this method, the Bitmap Offset subfield value always contains the number 0, and the Length field is $N_2 + 4$.

b) Method B: The Partial Virtual Bitmap field consists of a concatenation of octets numbered 0 to $N_0 – 1$ and octets numbered $N_1$ to $N_2$ of the traffic indication virtual bitmap, where $N_0$ is the smallest positive integer such that $N_0 \times 8 – 2^N < 8$. If $N_0$ is an odd number, then $N_1$ is the largest odd number such that $N_0 < N_1$ and each of the bits $N_0 \times 8$ to $(N_1 \times 8 – 1)$ is equal to 0. When $N_0$ is an even number, $N_1$ is the largest even number such that $N_0 < N_1$ and each of the bits $N_0 \times 8$ to $(N_1 \times 8 – 1)$ is equal to 0. If such a value $N_1 > N_0$ does not exist, $N_1 = N_0$. Additionally, $N_2$ is the smallest integer value for which the values for bit $(N_2 + 1) \times 8$ to 2007 in the bitmap are all 0. If such a value $N_2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N_2 = 250$. When using this method, the Bitmap Offset subfield contains the value of $(N_1 – N_0)/2$, and the Length field is $N_0 + N_2 – N_1 + 4$.

NOTE—When $N_1 = N_0$, Method B reduces to Method A.

For both Method A and Method B, when there are no frames buffered for any BSS corresponding to a transmitted or nontransmitted BSSID supported, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. When there are no buffered individually addressed frames for any BSS corresponding to a transmitted or nontransmitted BSSID, but there are buffered group addressed frames for one or more of the BSSs, the Partial Virtual Bitmap field consists of the octets number 0 to $N_0 – 1$ where $N_0$ is the smallest positive integer such that $(N_0 \times 8 – 2^N < 8)$. In this case, the Bitmap Offset subfield value contains the number 0, and the Length field is $N_0 + 3$.

### 8.4.2.8 IBSS Parameter Set element

The IBSS Parameter Set element contains the set of parameters necessary to support an IBSS. The Information field contains the ATIM Window parameter. See Figure 8-88.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>ATIM Window</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-88—IBSS Parameter Set element format**

The ATIM Window field is 2 octets in length and contains the ATIM Window length in TU.
8.4.2.9 Challenge Text element

The Challenge Text element contains the challenge text within Authentication exchanges. The length of the Information field is dependent upon the authentication algorithm and the transaction sequence number as specified in 11.2.3.2. See Figure 8-89.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Challenge Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1–253</td>
</tr>
</tbody>
</table>

**Figure 8-89—Challenge Text element format**

8.4.2.10 Country element

The Country element contains the information required to allow a STA to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. The format of this element is as shown in Figure 8-90.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Country String</th>
<th>First Channel Number / Operating Extension Identifier</th>
<th>Number of Channels / Operating Class</th>
<th>Maximum Transmit Power Level / Coverage Class</th>
<th>Pad (if needed)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>3</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0 or 1</td>
</tr>
</tbody>
</table>

**Figure 8-90—Country element format**

The element ID for this element is set to the value for Country, specified in Table 8-54. The length of the element is variable, as the element may contain more than one triplet comprising the First Channel Number, Number of Channels, and Maximum Transmit Power Level fields and referred to as subband triplets. Alternatively, where dot11OperatingClassesRequired is true and the First Channel Number/Operating Extension Identifier octet has a positive integer value of 201 or greater, then that triplet comprises the Operating Extension Identifier, Operating Class, and Coverage Class fields. Together they are referred to as an operating triplet. The minimum length of the element is 8 octets.

The Country String field of the element is 3 octets in length. The AP and mesh STA set this field to the value contained in the dot11CountryString attribute before transmission in a Beacon or Probe Response frame. Upon reception of this element, a STA sets the value of the dot11CountryString to the value contained in this field.

The First Channel Number/Operating Extension Identifier field is 1 octet in length. If the field has a positive integer value less than 201, then it contains a positive integer value that indicates the lowest channel number in the subband described in this element. The group of channels described by each pair of the First Channel Number and the Number of Channels fields do not have overlapping channel identifiers. [For example, the pairs (2,4) and (5,2) overlap and are not used together.] The First Channel Numbers are monotonically increasing where dot11OperatingClassesRequired is not true.

Where dot11OperatingClassesRequired is true, consecutive subband triplets following an operating triplet have monotonically increasing First Channel Number fields.

The Number of Channels field of the subelement is 1 octet in length.
The Maximum Transmit Power Level field is a signed number and is 1 octet in length. It indicates the maximum power, in dBm, allowed to be transmitted. As the method of measurement for maximum transmit power level differs by regulatory domain, the value in this field is interpreted according to the regulations applicable for the domain identified by the Country String.

An operating class is an index into a set of values for radio equipment sets of rules. The Operating Class field is 1 octet in length.

A coverage class is an index into a set of values for aAirPropagationTime. The Coverage Class field is 1 octet in length.

The Coverage Class field of the operating triplet specifies the aAirPropagationTime characteristic used in BSS operation, as shown in Table 8-56. The characteristic aAirPropagationTime describes variations in actual propagation time that are accounted for in a BSS and, together with maximum transmit power level, allow control of BSS diameter.

</tbody>
</table>
The Pad field is 0 or 1 octet in length. The length of the Country element is evenly divisible by 2. The Pad is used to add a single octet to the element if the length is not evenly divisible by 2. The value of the Pad field is 0.

### 8.4.2.11 Hopping Pattern Parameters element

The mechanisms described in this subclause are obsolete. Consequently, this subclause may be removed in a later revision of the standard.

The Hopping Pattern Parameters element contains the information necessary to allow a STA to calculate the code family using the hyperbolic congruence code (HCC) and extended HCC (EHCC) algorithms. See 9.18.3 for a description of the HCC and EHCC algorithms. The format of this element is as shown in Figure 8-91.

<table>

</tr>
</tbody>
</table>

The Pad field is 0 or 1 octet in length. The length of the Country element is evenly divisible by 2. The Pad is used to add a single octet to the element if the length is not evenly divisible by 2. The value of the Pad field is 0.

### 8.4.2.11 Hopping Pattern Parameters element

The mechanisms described in this subclause are obsolete. Consequently, this subclause may be removed in a later revision of the standard.

The Hopping Pattern Parameters element contains the information necessary to allow a STA to calculate the code family using the hyperbolic congruence code (HCC) and extended HCC (EHCC) algorithms. See 9.18.3 for a description of the HCC and EHCC algorithms. The format of this element is as shown in Figure 8-91.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Prime Radix</th>
<th>Number of Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-91—Hopping Pattern Parameters element**

The Element ID of this element is 8. The length of this element is 4 octets.

The Prime Radix field of this element indicates the value to be used as the prime radix (N) in the HCC and EHCC algorithms. The value of this field is a positive integer. The size of this field is 1 octet.

The Number of Channels field of this element indicates the value to be used as the maximum for the family index (a) in the HCC and EHCC algorithms. The value of this field is a positive integer and is not less than the prime radix minus 3 (N–3). The size of this field is 1 octet.
8.4.2.12 Hopping Pattern Table element

The Hopping Pattern Table element contains the information necessary for an FH implementation to be able to create the hopping sequences necessary to operate in the regulatory domain in which the element was received. The format of the element is as shown in Figure 8-92.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Flag</th>
<th>Number of Sets</th>
<th>Modulus</th>
<th>Offset</th>
<th>Random Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-92—Hopping Pattern Table element**

The Element ID of this element is set to the value for Hopping Pattern Table, specified in Table 8-54. The element is variable in length. The length of the element is indicated by the Length field.

The Flag field indicates that a Random Table is present when the value is 1. When the flag value is 0, it indicates that a Random Table is not present and that the hop index method is to be used to determine the hopping sequence. The size of this field is 1 octet.

The Number of Sets field indicates the total number of sets within the hopping patterns. The size of this field is 1 octet.

The Modulus and Offset fields indicate the values to be used in the equations to create a hopping sequence from the Random Table information. The size of these fields are each 1 octet.

The Random Table field is a variable-length field. It is a vector of single octet values that indicate the random sequence to be followed during a hopping sequence. The size of the Random Table field is found by subtracting 4 from the value of the Length field of this element.

See 9.18.4.

8.4.2.13 Request element

This element is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame. The format of the element is as shown in Figure 8-93.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Requested Element IDs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-93—Request element**

The Element ID of this element is set to the value for Request, specified in Table 8-54. The element is variable in length. The length of the element is indicated in the Length field.

The Requested Element IDs are the list of elements that are requested to be included in the Probe Response frame. The Requested Element IDs are listed in order of increasing element ID.

See 10.1.4.3.2 for additional requirements.
8.4.2.14 ERP element

The ERP element contains information on the presence of Clause 16 or Clause 17 STAs in the BSS that are not capable of Clause 19 (ERP-OFDM) data rates. It also contains the requirement of the ERP element sender (AP in an infrastructure BSS, STA in an IBSS, or mesh STA in an MBSS) as to the use of protection mechanisms to optimize BSS performance and as to the use of long or short Barker preambles. See Figure 8-94 for a definition of the frame element.

The ERP element has the form shown in Figure 8-94. Note that the length of this element is flexible and may be expanded in the future.

![ERP element](image)

The ERP Parameters field is defined in Figure 8-95.

![ERP Parameters field](image)

Recommended behavior for setting the Use_Protection bit is contained in 9.23.

8.4.2.15 Extended Supported Rates element

The Extended Supported Rates element specifies the rates in the OperationalRateSet parameter, as described in the MLME_JOIN.request and MLME_START.request primitives, and zero or more BSS membership selector values that are not carried in the Supported Rates element. The Information field is encoded as 1 to 255 octets where each octet describes a single supported rate or BSS membership selector.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each supported rate contained in the BSSBasicRateSet parameter, as defined in 6.3.11.2, is encoded as an octet with the MSB (bit 7) set to 1 and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 1 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'82'). Rates not contained in the BSSBasicRateSet parameter are encoded with the MSB set to 0, and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04'). The MSB of each octet in the Extended Supported Rate element in other management frame types is ignored by receiving STAs.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 8-55 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF').
The Extended Supported Rates element has the format shown in Figure 8-96.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Extended Supported Rates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**Figure 8-96—Extended Supported Rates element format**

See 10.1.4.6

### 8.4.2.16 Power Constraint element

The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. The format of the Power Constraint element is shown in Figure 8-97.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Local Power Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**Figure 8-97—Power Constraint element format**

The Length field is set to 1.

The field is coded as an unsigned integer in units of decibels. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel (from the MIB) in the Power Constraint element.

The Power Constraint element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Power Constraint elements is described in 10.8.4.

### 8.4.2.17 Power Capability element

The Power Capability element specifies the minimum and maximum transmit powers with which a STA is capable of transmitting in the current channel. The format of the Power Capability element is shown in Figure 8-98.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Minimum Transmit Power Capability</th>
<th>Maximum Transmit Power Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**Figure 8-98—Power Capability element format**

The Length field is set to 2.
The Minimum Transmit Power Capability field is set to the nominal minimum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW.

The Maximum Transmit Power Capability field is set to the nominal maximum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW.

The Power Capability element is included in Association Request frames, as described in 8.3.3.5; Reassociation Request frames, as described in 8.3.3.7; and Mesh Peering Open frame, as described in 8.5.16.2.2. The use of Power Capability elements is described in 10.8.2.

**8.4.2.18 TPC Request element**

The TPC Request element contains a request for a STA to report transmit power and link margin information using a TPC Report element. The format of the TPC Request element is shown in Figure 8-99.

![Figure 8-99—TPC Request element format](image)

The Length field is set to 0.

The TPC Request element is included in TPC Request frames, as described in 8.5.2.4. The use of TPC Request elements and frames is described in 10.8.6.

**8.4.2.19 TPC Report element**

The TPC Report element contains transmit power and link margin information sent in response to a TPC Request element or a Link Measurement Request frame. A TPC Report element is included in a Beacon frame or Probe Response frame without a corresponding request. The format of the TPC Report element is shown in Figure 8-100.

![Figure 8-100—TPC Report element format](image)

The Length field is set to 2.

The Transmit Power field is set to the transmit power used to transmit the frame containing the TPC Report element. The field is coded as a twos complement signed integer in units of decibels relative to 1 mW. The maximum tolerance for the transmit power value reported in the TPC Response element is ± 5 dB. This tolerance is defined as the difference, in decibels, between the reported power value and the actual EIRP of the STA (when transmitting 1500 octet frames or maximum MPDU sized-frames, whichever is smaller).

The Link Margin field contains the link margin for the receive time and for the receive rate of the frame containing the TPC Request element or the Link Measurement Request frame. The field is coded as a twos
complement signed integer in units of decibels. The Link Margin field is reserved when a TPC Report element is included in a Beacon frame or Probe Response frame. The measurement method of Link Margin is beyond the scope of this standard.

The TPC Report element is included in TPC Report frames, as described in 8.5.2.5; Link Measurement Report frames, as described in 8.5.7.5; Beacon frames, as described in 8.3.3.2; and Probe Response frames, as described in 8.3.3.10. The use of TPC Report elements and frames is described in 10.8.6.

### 8.4.2.20 Supported Channels element

The Supported Channels element contains a list of channel subbands (from those channels defined in 18.3.8.4.3) in which a STA is capable of operating. The format of the Supported Channels element is shown in Figure 8-101.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>First Channel Number</th>
<th>Number of Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-101—Supported Channels element format**

The Length field is variable and depends on the number of subbands, defined by a First Channel Number–Number of Channels pair, that are included in the element.

The First Channel Number field is set to the first channel (as defined in 18.3.8.4.3) in a subband of supported channels.

The Number of Channels field is set to the number of channels in a subband of supported channels.

The Supported Channels element is included in Association Request frames, as described in 8.3.3.5; Reassociation Request frames, as described in 8.3.3.7; and Mesh Peering Open frame, as described in 8.5.16.2.2. The use of the Supported Channels element is described in 10.9.2 and 10.9.8.

### 8.4.2.21 Channel Switch Announcement element

The Channel Switch Announcement element is used by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise when it is changing to a new channel and the channel number of the new channel. The format of the Channel Switch Announcement element is shown in Figure 8-102.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Channel Switch Mode</th>
<th>New Channel Number</th>
<th>Channel Switch Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-102—Channel Switch Announcement element format**

The Length field is set to 3.
The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP in a BSS or a STA in an IBSS sets the Channel Switch Mode field to either 0 or 1 on transmission. In an MBSS, the Channel Switch Mode Field is reserved. See 10.9.9.

The New Channel Number field is set to the number of the channel to which the STA is moving (as defined in 18.3.8.4.3).

For nonmesh STAs, the Channel Switch Count field either is set to the number of TBTTs until the STA sending the Channel Switch Announcement element switches to the new channel or is set to 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs at any time after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

The Channel Switch Announcement element is included in Channel Switch Announcement frames, as described in 8.5.2.6, and may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Channel Switch Announcement elements and frames is described in 10.9.8.

### 8.4.2.22 Secondary Channel Offset element

The Secondary Channel Offset element is used by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS together with the Channel Switch Announcement element when changing to a new 40 MHz channel. The format of the Secondary Channel Offset element is shown in Figure 8-103.

The Secondary Channel Offset element is included in Channel Switch Announcement frames, as described in 8.5.2.6.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length (=1)</th>
<th>Secondary Channel Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-103—Secondary Channel Offset element format**

The Secondary Channel Offset field of the Secondary Channel Offset element represents the position of the secondary channel relative to the primary channel. The values of the Secondary Channel Offset field are defined in Table 8-57.
8.4.2.23 Measurement Request element

8.4.2.23.1 General

The Measurement Request element contains a request that the receiving STA undertake the specified measurement action. The Measurement Request element is included in Spectrum Management Measurement Request frames, as described in 8.5.2.2, or Radio Measurement Request frames, as described in 8.5.7.2. Measurement Types 0, 1, and 2 are defined for spectrum management and are included only in Spectrum Management Measurement Request frames. The use of Measurement Request elements for spectrum management is described in 10.9.7. Measurement Types 3 to 9 and 255 are defined for radio measurement and are included only in Radio Measurement Request frames. The use of Measurement Request elements for radio measurement is described in 10.11.

The format of the Measurement Request element is shown in Figure 8-104.

<table>
<thead>
<tr>
<th>Value</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
<tr>
<td>3</td>
<td>SCB - secondary channel below</td>
<td>Indicates that the secondary channel is below the primary channel.</td>
</tr>
<tr>
<td>4–255</td>
<td>Reserved.</td>
<td></td>
</tr>
</tbody>
</table>

Table 8-57—Values of the Secondary Channel Offset field

The value of the Length field in octets is variable and depends on the length of the Measurement Request field. The minimum value of the Length field is 3 (based on a minimum length for the Measurement Request field of 0 octets).

The Measurement Token is set to a nonzero number that is unique among the Measurement Request elements in a particular Measurement Request frame.
The Measurement Request Mode field (shown in Figure 8-105) is a bit field with the following bits defined:

- The Parallel bit (bit 0) is used to request that more than one measurement is to be started in parallel. Parallel is set to 1 to request that the measurement is to start at the same time as the measurement described by the next Measurement Request element in the same Measurement Request frame. Parallel is set to 0 if the measurements are to be performed in sequence. The Parallel bit is reserved when Enable is 1, in the last or only measurement request element in the frame, or when the value of the Measurement Type field is 0, 1, or 2 (spectrum management measurements). See 10.11.6.

- The Enable bit (bit 1) is used to differentiate between a request to make a measurement and a request to control the measurement requests and triggered or autonomous reports generated by the destination STA. The Enable bit is further described in Table 8-58.

- Request bit (bit 2) is described in Table 8-58.

- Report bit (bit 3) is described in Table 8-58.

- The Duration Mandatory bit (bit 4) indicates whether the measurement duration contained within the Measurement Request is interpreted as mandatory by the STA receiving the request. A value of 0 indicates that the duration requested is a maximum duration, and the requesting STA accepts measurement results taken over any shorter duration. A value of 1 indicates that the duration requested is a mandatory duration. The Duration Mandatory bit is reserved when the Enable bit is 1, or when the value of the Measurement Type field is 0, 1, 2, 8, or 255. See 10.11.4.

- All other bits are reserved.

The use of the Enable, Request, and Report bits is summarized in Table 8-58. See 10.9.7 and 10.11.6 for the description of how a STA handles requests to enable or disable measurement requests and autonomous reports. See 10.11.8 for a description of the use of the Enable and Report bits in triggered reporting.

**Table 8-58—Summary of use of Enable, Request, and Report bits**

</tbody>
</table>

When the Enable bit is 0, the Measurement Request field contains the specification of a single measurement request corresponding to the Measurement Type, as described in 8.4.2.23.2 to 8.4.2.23.12. When the Enable bit is 1, the Measurement Request field is present only when requesting a triggered measurement.

#### 8.4.2.23.2 Basic request

A Measurement Type in the Measurement Request element may indicate a basic request. The Measurement Request field corresponding to a basic request is shown in Figure 8-106. See 10.9.7.

![Figure 8-106—Measurement Request field format for a basic request](image-url)

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).
The Measurement Start Time field is set to the TSF timer at the time (± 32 μs) at which the requested basic request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

8.4.2.23.3 CCA request

A Measurement Type in the Measurement Request element may indicate a CCA request. A response to a CCA request is a CCA report. It is optional for a STA to generate a CCA report in response to a CCA Request. The Measurement Request field corresponding to a CCA request is shown in Figure 8-107.

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested CCA request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

8.4.2.23.4 RPI histogram request

A Measurement Type in the Measurement Request element may indicate an RPI histogram request. A response to an RPI histogram request is an RPI histogram report. It is optional for a STA to generate a RPI histogram report in response to a RPI histogram request. The Measurement Request field corresponding to an RPI histogram request is shown in Figure 8-108.

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the requested RPI histogram request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.
8.4.2.23.5 Channel Load Request

The Measurement Request field corresponding to a Channel Load Request is shown in Figure 8-109.

<table>
<thead>
<tr>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Randomization Interval</th>
<th>Measurement Duration</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

![Figure 8-109—Measurement Request field format for Channel Load Request](image)

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-60. A Yes in the Extensible column of a subelement listed in Table 8-60 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>
<thead>
<tr>
<th>Subelement ID</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

![Table 8-60—Optional subelement IDs for Channel Load Request](image)

The Channel Load Reporting Information subelement indicates the condition for issuing a Channel Load Report. Channel Load Reporting Information subelement data field format is shown in Figure 8-110 and contains a 1-octet Reporting Condition subfield and a 1-octet Channel Load Reference Value subfield. The Reporting Condition is described in Table 8-61. The Channel Load Reference value is a Channel Load value as defined in 10.11.9.3 and is the reference value for the indicated Reporting Condition.
The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements might be included in the list of optional subelements.

### 8.4.2.23.6 Noise Histogram Request

The Measurement Request field corresponding to a Noise Histogram Request is shown in Figure 8-111.

<table>
<thead>
<tr>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Randomization Interval</th>
<th>Measurement Duration</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-111—Measurement Request field format for Noise Histogram Request**

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.
The Subelement ID field values for the defined optional subelements are shown in Table 8-62. A Yes in the Extensible column of a subelement listed in Table 8-62 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

### Table 8-62—Optional subelement IDs for Noise Histogram Request

</tbody>
</table>

The Noise Histogram Reporting Information subelement indicates the condition for issuing a Noise Histogram Report. The Noise Histogram Reporting Information subelement data field format is shown in Figure 8-112 and contains a 1-octet Reporting Condition subfield and a 1-octet ANPI Reference Value subfield. The Reporting Condition is described in Table 8-63. The ANPI Reference Value is an ANPI value as defined in 10.11.9.4 and is the reference value for the indicated Reporting Condition.

![Figure 8-112—Noise Histogram Reporting Information data field format](image)

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements might be included in the list of optional subelements.

</tr>
</tbody>
</table>

*Figure 8-113—Measurement Request field format for Beacon Request*

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E. A Channel Number of 0 indicates a request to make iterative measurements for all supported channels in the Operating Class where the measurement is permitted on the channel and the channel is valid for the current regulatory domain. A Channel Number of 255 indicates a request to make iterative measurements for all supported channels in the current Operating Class listed in the latest AP Channel Report received from the serving AP. The procedures for iterative measurements on multiple channels are described in 10.11.9.1.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

Measurement Mode indicates the mode to be used for the measurement. The valid measurement modes are listed in Table 8-64. The procedures for each mode are described in 10.11.9.1.

<table>
<thead>
<tr>

<td>3–255</td>
</tr>
</tbody>
</table>

*Table 8-64—Measurement Mode definitions for Beacon Request element*

The BSSID field indicates the BSSID of the BSS(s) for which a beacon report is requested. When requesting beacon reports for all BSSs on the channel, the BSSID field contains the wildcard BSSID; otherwise the BSSID field contains a specific BSSID for a single BSS.
The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-65. A Yes in the Extensible column of a subelement listed in Table 8-65 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The SSID subelement indicates the ESS(s) or IBSS(s) for which a beacon report is requested. When SSID is not included in a Beacon Request, the default “wildcard SSID” is used; otherwise the SSID is included in the Beacon Request and contains a specific SSID for a single ESS or IBSS. The wildcard SSID is used to represent all possible SSIDs. The SSID element is described in 8.4.2.2.

The Beacon Reporting Information subelement indicates the condition for issuing a Beacon Report. The Beacon Reporting Information subelement may be included in a Beacon Request only for repeated measurements. The Beacon Reporting Information subelement data field format is shown in Figure 8-114 and contains a 1-octet Reporting Condition subfield and a 1-octet Threshold/Offset Reference Value subfield. The Reporting Condition is described in Table 8-66. The Threshold/Offset Reference Value provides either the threshold value or the offset value to be used for conditional reporting. For Reporting Conditions 1 and 2, the threshold value is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the associated PHY Type. For Reporting Conditions 3 and 4, the threshold value is a logarithmic function of the signal-to-noise ratio, as described in 8.4.2.43. For Reporting Conditions 5 to 10, the offset value is an 8-bit two’s complement integer in units of 0.5 dBm. The indicated Reporting Condition applies individually to each measured Beacon, Measurement Pilot, or Probe Response. Reporting Conditions are further described in 10.11.9.1.
### Reporting Condition for Beacon Report

<table>
<thead>
<tr>
<th>Condition for report to be issued in Repeated Measurement</th>
<th>Reporting Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report to be issued after each measurement (default, used when Beacon Reporting Information subelement is not included in Beacon Request).</td>
<td>0</td>
</tr>
<tr>
<td>The measured RCPI level is greater than the threshold indicated in the Threshold/Offset Reference Value.</td>
<td>1</td>
</tr>
<tr>
<td>The measured RCPI level is less the threshold indicated in the Threshold/Offset Reference Value.</td>
<td>2</td>
</tr>
<tr>
<td>The measured RSNI level is greater than the threshold indicated in the Threshold/Offset Reference Value.</td>
<td>3</td>
</tr>
<tr>
<td>The measured RSNI level is less than the threshold indicated in the Threshold/Offset Reference Value.</td>
<td>4</td>
</tr>
<tr>
<td>The measured RCPI level is greater than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>5</td>
</tr>
<tr>
<td>The measured RCPI level is less than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>6</td>
</tr>
<tr>
<td>The measured RSNI level is greater than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>7</td>
</tr>
<tr>
<td>The measured RSNI level is less than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>8</td>
</tr>
<tr>
<td>The measured RCPI level is in a range bound by the serving AP’s reference RCPI and an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>9</td>
</tr>
<tr>
<td>The measured RSNI level is in a range bound by the serving AP’s reference RSNI and an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.</td>
<td>10</td>
</tr>
<tr>
<td>Reserved</td>
<td>11–255</td>
</tr>
</tbody>
</table>
The Reporting Detail subelement contains a 1-octet Reporting Detail data field that defines the level of detail per AP to be reported to the requesting STA. The Reporting Detail values are defined in Table 8-67.

### Table 8-67—Reporting Detail values

<table>
<thead>
<tr>
<th>Level of detail requested</th>
<th>Reporting Detail</th>
</tr>
</thead>
<tbody>
<tr>
<td>No fixed-length fields or elements</td>
<td>0</td>
</tr>
<tr>
<td>All fixed-length fields and any requested elements in the Request element if present</td>
<td>1</td>
</tr>
<tr>
<td>All fixed-length fields and elements (default, used when Reporting Detail subelement is not included in Beacon Request)</td>
<td>2</td>
</tr>
<tr>
<td>Reserved</td>
<td>3–255</td>
</tr>
</tbody>
</table>

The indicated Reporting Detail applies individually to each measured Beacon, Measurement Pilot, or Probe Response. If the Reporting Detail equals 1, a Request element is optionally present in the optional subelements field. If included, the Request element lists the Element IDs of the elements requested to be reported in the Reported Frame Body of the Beacon Report.

The Request, AP Channel Report, and Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.13, 8.4.2.38, and 8.4.2.28, respectively). Multiple AP Channel Report and Vendor Specific subelements can be included in the list of optional subelements.

If one or more AP Channel Report elements are included, they indicate that iterative measurements are requested first on the channel(s) indicated by the Operating Class and Channel Number fields included in the Beacon Request, and second on the channel(s) indicated by the Operating Class and Channel List fields of each AP Channel Report element included in the Beacon Request. The procedures for iterative measurements on multiple channels are described in 10.11.9.1.

**8.4.2.23.8 Frame request**

The Measurement Request field corresponding to a frame request is shown Figure 8-115.

<table>
<thead>
<tr>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Randomization Interval</th>
<th>Measurement Duration</th>
<th>Frame Request Type</th>
<th>MAC Address</th>
<th>Optional subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td>1</td>
<td>6</td>
</tr>
</tbody>
</table>

**Figure 8-115—Measurement Request field format for frame request**

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.
The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Frame Request Type indicates which subelements are requested in the Frame Report. The value of 1 signifies that a Frame Count Report is requested. The values 0 and 2 to 255 are reserved.

If the MAC Address field is the broadcast address, then all frames are counted towards the Frame Report generated in response to this frame request. For other MAC addresses, only frames matching this MAC address as the Transmitter Address are counted towards the Frame Report generated in response to this frame request.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-68. A Yes in the Extensible column of a subelement listed in Table 8-68 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### Table 8-68—Optional subelement IDs for frame request

<table>

</thead>
<tbody>
<tr>
<td>Octets: 6</td>
<td>2</td>
<td>2</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-116—Measurement Request field format for STA Statistics Request**

The Peer MAC Address field is the RA or TA MAC address for the frame statistics of this measurement.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the duration of the requested measurement in TUs except when triggered reporting is used. When triggered reporting is used, the measurement duration is 0.
Group Identity indicates the requested statistics group according to Table 8-69.

**Table 8-69—Group Identity for a STA Statistics Request**

<table>
<thead>
<tr>

<td>15</td>
</tr>
<tr>
<td>RSNA Counters</td>
<td>16</td>
</tr>
<tr>
<td>Reserved</td>
<td>17–255</td>
</tr>
</tbody>
</table>

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-70. A Yes in the Extensible column of a subelement listed in Table 8-70 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

**Table 8-70—Optional subelement IDs for STA Statistics Request**

<table>
<thead>

</tr>
</tbody>
</table>
The Triggered Reporting subelement is used to specify trigger conditions and thresholds for triggered STA Statistics measurements. It is present when setting up triggered reporting from STA Counters, QoS STA Counters, or RSNA Counters; see 10.11.9.5.

The format of the Triggered Reporting subelement for STA Counters is shown in Figure 8-117. The fields marked as optional are only present if the appropriate bit in the STA Counter Trigger Condition field is 1.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The STA Counter Trigger Condition field specifies trigger values used when requesting triggered STA Statistics reporting. The format of the STA Counter Trigger Condition field is shown in Figure 8-118.

For each bit in the STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-117) in the Triggered Reporting subelement for STA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding STA counter defined in 8-154 and 8-155 (in 8.4.2.24.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds. In the triggered STA Statistics request, the value of the Group Identity field is either 0 or 1. When the Group Identity field value of the triggered STA Statistics request is 0, B2–B6 in the STA Counter Trigger Condition field are set to 0. When the group identity of the triggered STA Statistics request is 1, B0 and B1 in the STA Counter Trigger Condition field are set to 0.
The format of the Triggered Reporting subelement for QoS STA Counters is shown in Figure 8-119. The fields marked as optional are only present if the appropriate bit in the QoS STA Counter Trigger Condition is 1.

![Figure 8-119—Triggered Reporting subelement for QoS STA Counters](image)

The UP of the QoS STA Counters for triggered QoS Statistics measurement is determined by the group identity of the measurement request field for a STA Statistics Request frame as defined in 8-69.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STAs that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The QoS STA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the QoS STA Counter Trigger Condition field is shown in Figure 8-120.

![Figure 8-120—QoS STA Counter Trigger Condition field](image)

For each bit in the QoS STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-119) in the Triggered Reporting subelement for QoS STA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding QoS STA counter defined in Figure 8-156 (in 8.4.2.24.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds.

The format of the Triggered Reporting subelement for RSNA Counters is shown in Figure 8-121. The fields marked as optional are only present if the appropriate bit in the RSNA Trigger Condition is 1.
The value in the Measurement Count field specifies the number of MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The RSNA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the RSNA Trigger Condition field is shown in Figure 8-122.

For each bit in the RSNA Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-121) in the Triggered Reporting subelement for RSNA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding RSNA counter defined in 8.4.2.24.9 exceeds the value of the specified threshold, within the total number of MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.23.10 Location Configuration Information Request

The Measurement Request field corresponding to an LCI request is shown in Figure 8-123.
The Location Subject field of a LCI request is a single octet. See Table 8-71.

<table>
<thead>
<tr>
<th>Value</th>
<th>Location Subject</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Location Subject Local</td>
</tr>
<tr>
<td>1</td>
<td>Location Subject Remote</td>
</tr>
<tr>
<td>2</td>
<td>Location Subject Third Party</td>
</tr>
<tr>
<td>3–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**Figure 8-123—Measurement Request field format for LCI Request**

The Location Subject field of a LCI request is a single octet. See Table 8-71.

Latitude Requested Resolution is the number of valid most significant bits requested for the fixed-point value of Latitude in degrees. Values above 34 (decimal), the specified maximum number of bits of Latitude, are reserved.

Longitude Requested Resolution is the number of valid most significant bits requested for the fixed-point value of Longitude in degrees. Values above 34 (decimal), the specified maximum number of bits of Longitude, are reserved.

Altitude Requested Resolution is the number of valid most significant bits requested for the Altitude, which has either of two types, as described in 8.4.2.24.10. Values above 30 (decimal), the specified maximum number of bits of Altitude, are reserved.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-72. A Yes in the Extensible column of a subelement listed in Table 8-72 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The Azimuth Request subelement is present when requesting azimuth information. The Azimuth Request subelement is as shown in Figure 8-124.

### Table 8-72—Optional subelement IDs for LCI Request

<table>
<thead>
<tr>
<th>Subelement ID</th>

<td></td>
</tr>
</tbody>
</table>

The value of the subelement ID is equal to the Azimuth Request value in Table 8-72.

The Length field value is set to 1.

The Azimuth Request field of an Azimuth Request subelement is shown in Figure 8-125.

Azimuth Resolution Requested is the number of valid most significant bits requested for the fixed-point value of Azimuth, reported in integer degrees. Values above 9 are reserved.

Azimuth Type (bit 4) is set to 1 to request a report of the Azimuth of radio reception and is set to 0 to request a report of the Azimuth of front surface of the reporting STA.

NOTE—A geographic feature is an abstraction of a real-world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth. The designation of a horizontal plane is relative to the Earth. The designation of the “front surface” of a station is arbitrary, but refers to an orientable surface (possessing a centerline) of the station. It is common to use a direction cosine matrix to convert from one coordinate system to another, i.e., body-centered coordinates to earth-centered coordinates.
The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Originator Requesting STA MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-126—Originator Requesting STA MAC Address subelement format**

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Originator Requesting STA MAC Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-127—Target MAC Address subelement format**

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

**8.4.2.23.11 Transmit Stream/Category Measurement Request**

The Transmit Stream/Category Measurement applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The Measurement Request field corresponding to a Transmit Stream/Category Measurement Request is shown in Figure 8-128.

<table>
<thead>
<tr>
<th>Randomization Interval</th>
<th>Measurement Duration</th>
<th>Peer STA Address</th>
<th>Traffic Identifier Bin 0 Range</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-128—Measurement Request field format for Transmit Stream/Category Measurement Request**

Randomization Interval is set to the desired maximum random delay in the measurement start time, expressed in units of TUs. The use of Randomization Interval is described in 10.11.3. When requesting a triggered Transmit Stream/Category Measurement, Randomization Interval is not used and is set to 0. See 10.11.9.8.

The Measurement Duration is set to the duration of the requested measurement, expressed in units of TUs except when setting up a triggered QoS measurement, when it is not used and is set to 0.

The Peer STA Address contains a MAC address indicating the RA in the MSDUs to be measured.

The Traffic Identifier field contains the TID subfield as shown in Figure 8-129.
The TID subfield indicates the TC or TS for which traffic is to be measured.

Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, expressed in units of TUs. The Bin 0 Range value is used to calculate the delay ranges of the other 5 bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as described in 8.4.2.24.11.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-73. A Yes in the Extensible column of a subelement listed in Table 8-73 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The Triggered Reporting subelement is used to specify measurement trigger thresholds. It is present only if requesting triggered transmit stream/category measurement reporting. The Triggered Reporting subelement field format is shown in Figure 8-130.

The value of the subelement ID is equal to the Triggered Reporting value in Table 8-73.
The value of the Length field in octets is equal to 6.

The Triggered Reporting field is as shown in Figure 8-131.

<table>
<thead>
<tr>
<th>Trigger Conditions</th>

</tr>
<tr>
<td>Bits:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>5</td>
</tr>
</tbody>
</table>

**Figure 8-132—Trigger Conditions bit-field**

- Average is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded out of the number of preceding MSDUs specified in Measurement Count is greater than or equal to the value given in Average Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.
- Consecutive is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded in succession is greater than or equal to the value given in Consecutive Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.
- Delay is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of consecutive MSDUs for the TC, or TS given by the TID that experience a transmit delay greater than or equal to the value specified in the Delay Threshold subfield, is greater than or equal to the value given in Delayed MSDU Count. Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSACK service class is being used.

The Average Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Average trigger condition. The field is reserved if the Average Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Consecutive Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Consecutive trigger condition. The field is reserved if the Consecutive Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Delay Threshold field contains two subfields as shown in Figure 8-133. The Delay Threshold field is reserved if the Delay Threshold subfield of the Trigger Conditions bit-field is 0.
Delayed MSDU Range contains a value representing the MSDU transmit delay at or above which an MSDU is counted towards the Delayed MSDU Count threshold. Delayed MSDU Range is encoded as a value representing the lower bound of a bin in the Transmit Delay Histogram as shown in Table 8-74. The Transmit Delay Histogram is defined in 8.4.2.24.11.

### Table 8-74—Delayed MSDU Range Definitions

<table>
<thead>
<tr>
<th>Delayed MSDU Range</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Transmit Delay = Lower Bound of Bin 2</td>

</tr>
<tr>
<td>2</td>
<td>Transmit Delay = Lower Bound of Bin 4</td>
</tr>
<tr>
<td>3</td>
<td>Transmit Delay = Lower Bound of Bin 5</td>
</tr>
</tbody>
</table>

Delayed MSDU Count contains a value representing the number of MSDUs to be used as the threshold value for the Delay trigger condition.

The Measurement Count field contains a number of MSDUs. This value is used to calculate an average discard count for the Average trigger condition. It is also used in place of measurement duration in determining the scope of the reported results when a report is triggered; see 10.11.9.8.

The Trigger Timeout field contains a value, expressed in units of 100 TU, during which a measuring STA does not generate further triggered transmit stream/category measurement reports after a trigger condition has been met. See 10.11.9.8.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.23 Measurement pause request

The Measurement Request field corresponding to a measurement pause request is shown in Figure 8-134. The measurement pause request cannot be processed in parallel with any other Measurement Request. See 10.11.9.7.

Octets: 2 variable
The Pause Time field contains a number between 1 and 65 535 representing the time period for which measurements are suspended or paused. The time unit for the Pause Time is 10 TUs. The Pause Time value 0 is reserved. Measurement pause requests are used to provide time delays between the execution times of measurement request elements in a Measurement Request frame.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-75. A Yes in the Extensible column of a subelement listed in Table 8-75 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>

</tr>
</tbody>
</table>

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.23.13 Multicast Diagnostics Request

The Measurement Request field corresponding to a Multicast Diagnostics Request is shown in Figure 8-135. The response to a Multicast Diagnostics Request is a Multicast Diagnostics Report.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>Randomization Interval</th>
<th>Measurement Duration</th>
<th>Group MAC Address</th>
<th>Multicast Triggered Reporting (optional)</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2</td>
<td>6</td>
<td>0 or 5</td>
<td>variable</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-135—Measurement Request field format for a Multicast Diagnostics Request**

The Randomization Interval field is the desired upper limit of random delay before the measurement begins, expressed in TUs. The use of the Randomization Interval is described in 10.12.3. When requesting a triggered multicast diagnostic report, the Randomization Interval field is reserved.

The Measurement Duration field is the duration of the requested measurement, expressed in TUs. When requesting a triggered multicast diagnostic report, the Measurement Duration field is reserved.

A Group MAC Address field with the LSB of the first octet set to 1 contains the MAC address of the group addressed frames to which the measurement request relates. A Group MAC Address field with the LSB of the first octet set to 0 indicates that all group addressed frames, apart from the broadcast MAC address, are requested.
The Multicast Trigger Reporting field is used to specify trigger conditions and thresholds. It is only present when requesting triggered multicast diagnostic reporting. The format of Multicast Triggered Reporting subelement is as shown in Figure 8-136.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Multicast Trigger Condition</th>
<th>Inactivity Timeout</th>
<th>Reactivation Delay</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-136—Multicast Triggered Reporting subelement format**

The Multicast Trigger Condition field specifies reporting triggers for triggered management diagnostic reporting. The format of the Multicast Trigger Condition field is shown in Figure 8-137.

```
B0  B1  B7
Inactivity Timeout Request  Reserved

Bits: 1 7
```

**Figure 8-137—Multicast Trigger Condition field**

The Inactivity Timeout Request field is 1 to request that a Multicast Triggered Report be generated when no group addressed frames with the monitored group address are received in a time equal to the value given in the Inactivity Timeout field. The Inactivity Timeout Request field is 0 when a multicast reception timeout is not requested.

The Inactivity Timeout field contains a time value in units of 100 TUs to be used as the threshold value for the Inactivity Timeout trigger condition.

The Reactivation Delay field contains a value in units of 100 TUs during which a measuring STA does not generate further Multicast Triggered Reports after a trigger condition has been met.

The Optional Subelements field format contains zero or more Subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-76. A Yes in the Extensible column of a subelement listed in Table 8-76 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The use of Multicast Diagnostics Request is defined in 10.11.19.
8.4.2.23.14 Location Civic Request

The Measurement Request field corresponding to a Location Civic Request is shown in Figure 8-138. The response to a Location Civic Request is a Location Civic Report.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>

<td>1 to 239</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 8-138—Location Civic Request field format

The Location Subject field is a single octet and is defined in Table 8-71.

The Civic Location Type field contains the format of location information in the Location Civic Report, as indicated in Table 8-77.

<table>
<thead>
<tr>
<th>Civic Location Type value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>IETF RFC4776-2006; includes all subsequent RFCs that define additional civic address Types</td>
</tr>
<tr>
<td>1</td>
<td>Vendor Specific</td>
</tr>
<tr>
<td>2–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type.

The Location Service Interval Units field contains the units for the Location Service Interval field, as indicated in Table 8-78.
The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Civic Reports. A Location Service Interval of 0 indicates that only a single Location Civic Report is requested.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-79. A Yes in the Extensible column of a subelement listed in Table 8-79 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>

</tbody>
</table>

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting for the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC address subelement is shown in Figure 8-127.

8.4.2.23.15 Location Identifier Request

The Measurement Request field corresponding to a Location Identifier Request is shown in Figure 8-139. The response to a Location Identifier Request is a Location Identifier Report.
The Location Subject field is a single octet and is defined in Table 8-71.

The Location Service Interval Units field is defined in Table 8-78.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Identifier Reports. A Location Service Interval of 0 indicates that only a single Location Identifier Report is requested.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-80. A Yes in the Extensible column of a subelement listed in Table 8-80 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

</table>

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.
8.4.2.24 Measurement Report element

8.4.2.24.1 General

The Measurement Report element contains a measurement report. The format of the Measurement Report element is shown in Figure 8-140. The Measurement Report element is included in Spectrum Management Measurement Report frames, as described in 8.5.2.3, or Radio Measurement Report frames, as described in 8.5.7.3. Measurement Types 0, 1, and 2 are used for spectrum management and are included only in Spectrum Management Measurement Report frames. All other Measurement Types are used for radio measurement and are included only in Radio Measurement Report frames. The use of Measurement Report elements and frames for spectrum management is described in 10.9.7. The use of Measurement Report elements and frames for radio measurement is described in 10.11.

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>Late</td>
<td>Incapable</td>
<td>Refused</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-141—Measurement Report Mode field**

The value of the Length field in octets is variable and depends on the length of the Measurement Report field. The minimum value of the Length field is 3.

The Measurement Token field is set to the Measurement Token in the corresponding Measurement Request element. If the Measurement Report element is being sent autonomously, then the Measurement Token is set to 0. If the Measurement Report element is being sent in a Location Track Notification frame then the Measurement Token is set to the same value as the Location Configuration Request frame Dialog Token field that configured the STA to send the location track notification frames.

The Measurement Report Mode field (shown in Figure 8-141) is used to indicate the reason for a failed or rejected measurement request. The Measurement Report Mode is a bit field with the following bits defined:

- Late bit (bit 0) indicates whether this STA is unable to carry out a measurement request because it received the request after the requested measurement time. The Late bit is set to 1 to indicate the request was too late. The Late bit is set to 0 to indicate the request was received in time for the measurement to be executed. The Late bit only applies to spectrum management measurement and is set to 0 in all measurement report elements for radio measurement types (see Table 8-81).

- Incapable bit (bit 1) indicates whether this STA is incapable of generating a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Incapable bit is set to 1 to indicate the STA is incapable. The Incapable bit is set to 0 to indicate the STA is capable or the report is autonomous.

- Refused bit (bit 2) indicates whether this STA is refusing to generate a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Refused bit is set to 1 to indicate the STA is refusing. The Refused bit is set to 0 to indicate the STA is not refusing or the report is autonomous.
All other bits are reserved.

<td>N/A</td>
</tr>
</tbody>
</table>

No more than one bit is set to 1 within a Measurement Report Mode field. All bits within the Measurement Mode field are set to 0 if the results of a successful measurement request or an autonomous measurement are being reported.

The Measurement Type field is set to a number that identifies the measurement report. The Measurement Types that have been allocated are shown in Table 8-81.

The Measurement Report field is not present when the Late bit is equal to 1, the Incapable bit is equal to 1, or the Refused bit is equal to 1. Otherwise, it contains a single measurement report, as described in 8.4.2.24.2 to 8.4.2.24.11.

8.4.2.24.2 Basic report

A Measurement Type in the Measurement Report element may indicate a basic report. The format of the Measurement Report field corresponding to a basic report is shown in Figure 8-142. It is mandatory for a STA to support the generation of this report.
The Channel Number field is set to the channel number to which the basic report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 μs) at which the basic report measurement started.

The Measurement Duration field is set to the duration over which the basic report was measured, expressed in TUs.

The Map field is coded as a bit field, as shown in Figure 8-143, and contains the following bits:

- BSS bit, which is set to 1 when at least one valid MPDU was received in the channel during the measurement period from another BSS. Otherwise, the BSS bit is set to 0.
- OFDM preamble bit, which is set to 1 when at least one sequence of short training symbols, as defined in 18.3.3, was detected in the channel during the measurement period without a subsequent valid SIGNAL field (see 18.3.4). This may indicate the presence of an OFDM preamble, such as high-performance RLAN/2 (HIPERLAN/2). Otherwise, the OFDM preamble bit is set to 0.
- Unidentified Signal bit, which may be set to 1 when, in the channel during the measurement period, there is significant power detected that is not characterized as radar, an OFDM preamble, or a valid MPDU. Otherwise, the Unidentified Signal bit is set to 0. The definition of significant power is implementation dependent.
- Radar bit, which is set to 1 when radar was detected operating in the channel during the measurement period. The radar detection algorithm that satisfies regulatory requirements is outside the scope of this standard. Otherwise, the Radar bit is set to 0.
- Unmeasured bit, which is set to 1 when this channel has not been measured. Otherwise, the Unmeasured bit is set to 0. When the Unmeasured field is equal to 1, all the other bit fields are set to 0.

### 8.4.2.24.3 CCA report

A Measurement Type in the Measurement Report element may indicate a CCA report. It is optional for a STA to support the generation of this report. The format of the Measurement Report field corresponding to a CCA report is shown in Figure 8-144.
The Channel Number field contains the channel number to which the CCA report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time ($\pm$ 32 $\mu$s) at which the CCA report measurement started.

The Measurement Duration field is set to the duration over which the CCA report was measured, expressed in TUs.

The CCA Busy Fraction field contains the fractional duration over which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds. The CCA Busy Fraction value is defined as Ceiling ($255 \times \frac{\text{Duration CCA indicated channel was busy (\mu s)}}{1024 \times \text{Measurement duration (TUs)}}$).

### 8.4.2.24.4 RPI histogram report

A Measurement Type in the Measurement Report element may indicate an RPI histogram report. It is optional for a STA to support the generation of this report. The format of the Measurement Report field corresponding to an RPI histogram report is shown in Figure 8-145.

![Figure 8-144—Measurement Report field format for a CCA report](image)

![Figure 8-145—Measurement Report field format for an RPI histogram report](image)

The Channel Number field is set to the channel number to which the RPI histogram report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time ($\pm$ 32 $\mu$s) at which the RPI histogram report measurement started.

The Measurement Duration field is set to the duration over which the RPI histogram report was measured, expressed in TUs.

The RPI histogram report contains the RPI densities observed in the channel for the eight RPI levels defined in Table 8-82. See 10.11.12.
The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA may use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

### 8.4.2.24.5 Channel Load Report

The format of the Measurement Report field corresponding to a Channel Load Report is shown in Figure 8-146.

<table>
<thead>
<tr>
<th>RPI</th>
<th>Power observed at the antenna (dBm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>(\text{Power} \leq -87)</td>
</tr>
<tr>
<td>1</td>
<td>(-87 &lt; \text{Power} \leq -82)</td>
</tr>
<tr>
<td>2</td>
<td>(-82 &lt; \text{Power} \leq -77)</td>
</tr>
<tr>
<td>3</td>
<td>(-77 &lt; \text{Power} \leq -72)</td>
</tr>
<tr>
<td>4</td>
<td>(-72 &lt; \text{Power} \leq -67)</td>
</tr>
<tr>
<td>5</td>
<td>(-67 &lt; \text{Power} \leq -62)</td>
</tr>
<tr>
<td>6</td>
<td>(-62 &lt; \text{Power} \leq -57)</td>
</tr>
<tr>
<td>7</td>
<td>(-57 &lt; \text{Power})</td>
</tr>
</tbody>
</table>

The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA may use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

### 8.4.2.24.5 Channel Load Report

The format of the Measurement Report field corresponding to a Channel Load Report is shown in Figure 8-146.

<table>
<thead>
<tr>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Actual Measurement Start Time</th>
<th>Measurement Duration</th>
<th>Channel Load</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>8</td>
<td>2</td>
<td>1</td>
</tr>
</tbody>
</table>

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Channel Load Report was measured, expressed in units of TUs.

Channel Load contains the proportion of measurement duration for which the measuring STA determined the channel to be busy. Procedure for Channel Load measurement and definition of channel load values are found in 10.11.9.3.
The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-83. A Yes in the Extensible column of a subelement listed in Table 8-83 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–220</td>
<td>Reserved</td>

<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>1 to 237</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

**8.4.2.24.6 Noise Histogram Report**

The format of the Measurement Report field of a Noise Histogram Report is shown in Figure 8-147.

<table>
<thead>
<tr>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Actual Measurement Start Time</th>
<th>Measurement Duration</th>
<th>Antenna ID</th>
<th>ANPI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>

<td>IPI 2 Density</td>
<td>· · ·</td>
<td>IPI 8 Density</td>
<td>IPI 9 Density</td>
</tr>
<tr>
<td>Octets: 1</td>
<td>1</td>
<td>1</td>
<td>5</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
Antenna ID is set to the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 8.4.2.42.

ANPI is set to the average noise plus interference power value measured during the indicated Measurement Duration while the indicated channel is idle as described in 10.11.9.4.

The Noise Histogram Report contains the IPI densities, as defined in 10.11.9.4, observed in the channel for the eleven IPI levels defined in Table 8-84.

### Table 8-84—IPI Definitions for a Noise Histogram Report

<table>
<thead>
<tr>
<th>IPI Level</th>

<td>$-60 &lt; \text{IPI} \leq -55$</td>
</tr>
<tr>
<td>10</td>
<td>$-55 &lt; \text{IPI}$</td>
</tr>
</tbody>
</table>

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-85. A Yes in the Extensible column of a subelement listed in Table 8-85 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

### Table 8-85—Optional subelement IDs for Noise Histogram Report

<table>
<thead>
<tr>

<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.
8.4.2.24.7 Beacon Report

The format of the Measurement Report field corresponding to a Beacon Report is shown in Figure 8-148.

![Figure 8-148—Measurement Report field format for Beacon Report](image)

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Beacon Report was measured, expressed in units of TUs.

The Reported Frame Information field contains two subfields as shown in Figure 8-149.

![Figure 8-149—Reported Frame Information field](image)

Condensed PHY Type indicates the physical medium type on which the Beacon, Measurement Pilot, or Probe Response frame being reported was received. It has an integer value between 0 and 127 coded according to the value of dot11PHYType.

Reported Frame Type indicates the type of frame reported. A value of 0 indicates a Beacon or Probe Response frame; a value of 1 indicates a Measurement Pilot frame.

RCPI indicates the received channel power of the Beacon, Measurement Pilot, or Probe Response frame, which is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the indicated PHY Type.

RSNI indicates the received signal to noise indication for the Beacon, Measurement Pilot, or Probe Response frame, as described in 8.4.2.43.
The BSSID field contains the BSSID from the Beacon, Measurement Pilot, or Probe Response frame being reported.

The Antenna ID field contains the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 8.4.2.42.

The Parent TSF field contains the lower 4 octets of the measuring STA’s TSF timer value at the start of reception of the first octet of the timestamp field of the reported Beacon, Measurement Pilot, or Probe Response frame at the time the Beacon, Measurement Pilot, or Probe Response frame being reported was received.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-86. A Yes in the Extensible column of a subelement listed in Table 8-86 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

**Table 8-86—Optional subelement IDs for Beacon Report**

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Reported Frame Body</td>
<td>0 to 224</td>
<td></td>
</tr>
<tr>
<td>2–220</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>1 to 224</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Reported Frame Body subelement contains the requested fields and elements of the frame body of the reported Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail subelement of the corresponding Beacon Request equals 0, the Reported Frame Body subelement is not included in the Beacon Report. If the Reporting Detail subelement equals 1, all fixed fields and any elements whose Element IDs are present in the Request element in the corresponding Beacon Request are included in the Reported Frame Body subelement, in the order that they appeared in the reported frame. If the Reporting Detail field equals 2, all fixed fields and elements are included in the order they appeared in the reported frame. Reported TIM elements are truncated such that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. Reported IBSS dynamic frequency selection (DFS) elements shall be truncated so that only the lowest and highest channel number map are reported and the element Length field is modified to indicate the truncated length of 13. Reported RSNEs shall be truncated so that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. If the length of the Reported Frame Body subelement would cause the Measurement Report element to exceed the maximum element size, then the Reported Frame Body subelement is truncated so that the last element in the Reported Frame Body subelement is a complete element.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.
8.4.2.24.8 Frame Report

The format of the Measurement Report field corresponding to a Frame Report is shown in Figure 8-150.

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Frame Report was measured, expressed in units of TUs.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-87. A Yes in the Extensible column of a subelement listed in Table 8-87 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<td>1</td>
</tr>
</tbody>
</table>

Figure 8-152—Frame Report Entry field format

The Transmit Address field contains the Transmitter Address (TA) from the frames being reported.

The BSSID field contains the BSSID from the frames being reported.

PHY Type indicates the physical medium type for the frame(s) being reported. Valid entries are coded according to the value of dot11PHYType.

Average RCPI indicates the average value for the received channel power of frames received and counted in this Frame Report Entry, as described in 10.11.9.2. Average RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

Last RSNI indicates the received signal to noise indication of the most recently measured frame counted in this Frame Report Entry, as described in 8.4.2.43.

Last RCPI indicates the received channel power of the most recently measured frame counted in this Frame Report entry. Last RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Antenna ID field contains the identifying number for the antenna(s) used to receive the most recently measured frame counted in this Frame Report entry. Antenna ID is defined in 8.4.2.42.

Frame Count is a count of the data and management frames received with the indicated Transmit Address and BSSID during the measurement duration. The value 65 535 indicates a count of 65 535 or more.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.
8.4.2.24.9 STA Statistics Report

The format of the Measurement Report field of a STA Statistics Report is shown in Figure 8-153.

![Figure 8-153—Measurement Report field format for STA Statistics Report](image)

The STA Statistics Report reports the change in the requested Statistics Group Data values measured within the Measurement Duration. When the Measurement Duration is equal to 0 the current values of the requested Statistics Group Data is reported, rather than the change.

The Measurement Duration is set to the duration over which the change in Statistics Group Data was measured and reported, expressed in units of TUs. A Measurement Duration value of 0 indicates a report of the current values of the Statistics Group Data.

Group Identity indicates the requested statistics group describing the Statistics Group Data according to Table 8-88.

Statistics Group Data contains the requested statistics from the MIB in Annex C related to the interface on which the request was received according to Table 8-88. Units used for reporting a statistic or change in statistic are the units used to define the statistic in Annex C. When Measurement Duration value is nonzero, the reported data values for statistics that are not counters are the current values of the statistics data at the end of the Measurement Duration.

<table>

**Figure 8-155—Measurement Report field format for dot11MACStatistics Group**

The format of the Measurement Report field for dot11QosCounters Group for UPx is shown in Figure 8-156, where x is 0 – 7 and where the listed variables are obtained from the column of the QoS Counters Table indexed by x + 1. For example, the variables for dot11QosCounters Group for UP2 are from the third column of the dot11QosCountersTable, obtained from the dot11QosCountersEntry in which dot11QosCountersIndex is equal to 3.
The format of the Measurement Report field for dot11BSSAverageAccessDelay Group is shown in Figure 8-157. Non-QoS APs set dot11STAStatisticsAverageAccessDelayBestEffort, dot11STAStatisticsAverageAccessDelayBackGround, dot11STAStatisticsAverageAccessDelayVideo, and dot11STAStatisticsAverageAccessDelayVoice to 255 (not available).

The format of the Measurement Report field for dot11QosCounters Group for UPx is shown in Figure 8-156. The format of the Measurement Report field for dot11BSSAverageAccessDelay Group is shown in Figure 8-157. The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-89. A Yes in the Extensible column of a subelement listed in Table 8-89 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The format of the Measurement Report field for RSNA Counters Group is shown in Figure 8-158.

<table>

The Reporting Reason subelement indicates the reason why the measuring STA sent the STA Statistics report. It is present if Statistics Group Name is from STA Counters, QoS STA Counters, or RSNA Counters (see 10.11.9.5).

The Reporting Reason subelement for STA Statistics Group Identities 0 or 1 (STA Counters) is shown in Figure 8-159.
The Reporting Reason subelement for STA Statistics Group Identity 2 to 9 (QoS STA Counters) is shown in Figure 8-160.

+-----------------+-----------------+-----------------+-----------------+

Figure 8-161—Reporting Reason subelement for RSNA Counters
```

In a nontriggered STA Statistics Report, all fields in the Reporting Reason subelement are set to 0.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.24.10 Location Configuration Information Report

An LCI Report includes Latitude, Longitude, Altitude, and optional Azimuth information. The LCI report format is shown in Figure 8-162.

This structure and information fields are little-endian, per conventions defined in 8.2.2, and are based on the LCI format described in IETF RFC 3825.

The definition of elements within the LCI report are as defined in Section 2.1 of IETF RFC 3825 (July 2004) or as defined herein.
NOTE—An example of fixed/fractional notation, using the longitude of the Sears Tower from p. 13 of IETF RFC 3825 (July 2004):

Longitude 87.63602 degrees West (or –87.63602 degrees),
Using two's complement, 34 bit fixed point, 25 bit fraction,
Longitude = 0xf50ba5b97,
Longitude = 1101010000101110110010011011110011111 (big-endian)
DSE registered location expression for a Longitude resolution of 34-bits:
Bits 56–61 Longitude resolution = (bit 56) 0 1 0 0 0 1 (bit 61)
Bits 62–86 Longitude fraction = (bit 62) 1 1 1 0 1 0 0 1 1 1 0 1 1 0 1 0 1 1 1 1 0 1 0 (bit 86)
Bits 87–95 Longitude integer = (bit 87) 0 0 0 1 0 1 0 1 1 (bit 95)
The octets in transmission order = E2 E5 96 2E D4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-90. A Yes in the Extensible column of a subelement listed in Table 8-90 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The Azimuth Report subelement is used to report an azimuth. The Azimuth Report subelement is as shown in Figure 8-163.

The value of the subelement ID is equal to the Azimuth Report value in Table 8-90.

The value of the Length field in octets is equal to 1.

The Azimuth Report field of an Azimuth Report subelement contains three subfields as shown in Figure 8-164.

Azimuth Type is set to 1 to report the Azimuth of the bearing of the requestor with respect to the responder, and is set to 0 to report the Azimuth of front surface of the reporting STA.

Azimuth Resolution is 4 bits, indicating the number of valid most significant bits in the Azimuth.

Azimuth is a 9-bit unsigned integer value in degrees from true north, of the type defined by the Azimuth Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding LCI Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.
The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding LCI Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.24.11 Transmit Stream/Category Measurement Report

The Transmit Stream/Category Measurement applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The format of the Measurement Report field corresponding to a Transmit Stream/Category Measurement Report is shown in Figure 8-165.

**Figure 8-165—Measurement Report field format for Transmit Stream/Category Measurement Report**

Actual Measurement Start Time is set to the TSF at the time at which the measurement started, or for a triggered Transmit Stream/Category Measurement Report, the TSF value at the reporting QoS STA when the trigger condition was met.

Measurement Duration is set to the duration over which the Transmit Stream/Category Measurement Report was measured, expressed in units of TUs. For a triggered Transmit Stream/Category Measurement Report, metrics are reported over a number of transmitted MSDUs rather than a duration; hence Measurement Duration is set to 0; see 10.11.9.8.

The Peer STA Address contains a MAC address indicating the RA for the measured frames.

The Traffic Identifier field contains the TID subfield as shown in Figure 8-128. The TID subfield indicates the TC or TS for which traffic was measured.

The Reporting Reason field is a bit field indicating the reason that the measuring QoS STA sent the transmit stream/category measurement report. The Reporting Reason field is shown in Figure 8-166.
— The Average Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the Average Error trigger.

— The Consecutive Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the Consecutive Error trigger.

— The Delay Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the delay exceeding the Delay Threshold.

When a Transmit Stream/Category Measurement Report is sent as a direct response to a Transmit Stream/Category Measurement Request and not as a triggered Transmit Stream/Category Measurement Report, all bit fields in the Reporting Reason field are set to 0. This is termed a requested Transmit Stream/Category Measurement Report. Within a triggered Transmit Stream/Category Measurement Report, more than one bit field in the Reporting Reason field might be set to 1 if more than one trigger condition was met.

The Transmitted MSDU Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted.

The MSDU Discarded Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due either to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate), or due to the MSDU lifetime having been reached.

The MSDU Failed Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate).

The MSDU Multiple Retry Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted after more than one retransmission attempt.

The QoS CF-Polls Lost Count field contains the number of QoS (+)CF-Poll frames that were transmitted where there was no response from the QoS STA. QoS CF-Polls Lost Count are returned only if the reporting QoS STA is contained within an AP and the TID is for a TS. This field is set to 0 when QoS CF-Polls Lost Count is not returned.

Average Queue Delay is the average queuing delay of the frames (MSDUs) that are passed to the MAC for the indicated Peer STA Address and the indicated Traffic Identifier. Queue Delay is expressed in TUs and is measured from the time the MSDU is passed to the MAC until the point at which the first or only fragment begins transmission.
Average Transmit Delay is the average delay of the frames (MSDUs) that are successfully transmitted for the indicated Peer STA Address and TID. Average Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSAck service class is being used. Average Transmit delay is expressed in units of TUs.

Bin 0 Range field value indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, expressed in units of TUs. It is also used to calculate the delay ranges of the other five bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as follows:

- Bin 0 range: \(0 \leq \text{Delay} < B_0\) = Bin 0 Range field value
- Bin i range: \(2^{i-1} \times B_0 \leq \text{Delay} < 2^i \times B_0\), for \(1 \leq i \leq 4\)
- Bin 5 range: \(16 \times B_0 \leq \text{Delay}\)

For example, if Bin 0 Range field value is 10 TUs, the bin delay ranges are as defined in Table 8-91.

<table>
<thead>
<tr>
<th>Bin</th>
<th>Measured MSDU Transmit Delay (TUs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Delay &lt; 10</td>
</tr>
<tr>
<td>1</td>
<td>10 \leq \text{Delay} &lt; 20</td>
</tr>
<tr>
<td>2</td>
<td>20 \leq \text{Delay} &lt; 40</td>
</tr>
<tr>
<td>3</td>
<td>40 \leq \text{Delay} &lt; 80</td>
</tr>
<tr>
<td>4</td>
<td>80 \leq \text{Delay} &lt; 160</td>
</tr>
<tr>
<td>5</td>
<td>160 \leq \text{Delay}</td>
</tr>
</tbody>
</table>

To compute the value reported in Bin i (i.e., \(B_i\) for \(i = 0, 1...5\) of the Transmit Delay Histogram), the STA initializes all bin values to 0. For each MSDU successfully transmitted, the measured MSDU Transmit Delay determines which bin is to be incremented. If the measured delay has a duration time \(t\) within Bin i, then Bin i is increased by one. MSDU Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSAck service class is being used. The sum of the values in all six bins is equal to the value reported in the Transmitted MSDU Count.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-92. A Yes in the Extensible column of a subelement listed in Table 8-92 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.24.12 Multicast Diagnostics Report

The format of the Measurement Report field of a Multicast Diagnostics report is shown in Figure 8-167.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>Measurement Time</th>
<th>Measurement Duration</th>

<tbody>
<tr>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-167—Measurement Report field format for a Multicast Diagnostics Report**

The Measurement Time field is the value of the STA TSF timer at the time the measurement started. For a triggered Multicast Diagnostics report, this is the TSF value at the reporting STA when the trigger condition was met. When the reason for sending the report is Performance Measurement and the Multicast Received MSDU Count is nonzero, the Measurement Time field is the value of the STA TSF timer at the time of the first group addressed MSDU received during the measurement interval.

The Measurement Duration field specifies the period over which the Multicast Diagnostic Report was generated, expressed in units of TUs.

The Group MAC Address field contains the value from the Group MAC Address field from the Multicast Diagnostics Request to which the report relates.

The Multicast Reporting Reason field indicates the reason why the measuring STA sent the Multicast Diagnostics report. The Multicast Reporting Reason field is shown in Figure 8-168.

**Figure 8-168—Multicast Reporting Reason field**
The subfields of the Multicast Reporting Reason field are defined as follows:

- The Inactivity Timeout Trigger field set to 1 indicates that Multicast Diagnostics Report was generated as a triggered report due to the timeout of the multicast diagnostic timer.
- The Measurement Result field set to 1 indicates that the Multicast Diagnostic Report contains the result of completing a multicast diagnostic request that did not contain a Multicast Triggered Reporting subelement.

All the bits in the Multicast Reporting Reason field are independent.

The Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated Multicast MAC Address that were received during the Measurement Duration. For a triggered multicast diagnostics measurement, the Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated Multicast MAC Address that were received between the acceptance of the multicast diagnostics measurement request and the occurrence of the trigger condition.

When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 1, the twelve LSBs of the First Sequence Number field contain the sequence number of the first frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 0, the twelve LSBs of the First Sequence Number field contain the sequence number of the first group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the First Sequence Number field are set to 0.

When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 1, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 0, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the Last Sequence Number field are set to 0.

The First Sequence Number field and the Last Sequence Number field are set to 0 if the Multicast Received MSDU Count is 0.

The Multicast Rate field specifies the highest data rate, in 0.5 Mb/s units, at which the STA has received a group addressed frame with a valid FCS during the measurement period. The Multicast Rate field is encoded with the MSB set to 1 to indicate that the data rate is in the basic rate set, and set to 0 to indicate that the data rate is not in the basic rate set. The remaining 15 bit value is multiplied by 0.5 Mb/s to indicate the data rate. The Multicast Rate field is 0 by the STA to indicate that it has not received a group addressed frame with a valid FCS during the measurement period.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-93. A Yes in the Extensible column of a subelement listed in Table 8-93 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The summary of fields used in the STA Multicast Diagnostics Report is shown in Table 8-94.

**Table 8-93—Optional subelement IDs for Multicast Diagnostics Report**

**Figure 8-169—Location Civic Report field format**

The Civic Location Type field contains the format of location information in the Civic Location field, as indicated in Table 8-77.

When the Civic Location Type is IETF RFC4776-2006, the Optional Subelements field may optionally include the Location Reference, Location Shape, Map Image, and Vendor Specific subelements as defined in Table 8-95.
When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-95. A Yes in the Extensible column of a subelement listed in Table 8-95 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding Location Civic Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding Location Civic Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The format of the Location Reference subelement is shown in Figure 8-170.

```

```

**Figure 8-170—Location Reference subelement format**
The Location Reference is an ASCII string that defines a position on a floor from which the relative location contained in the Location Shape subelement is offset. A Location Reference value of 0 length indicates that the position of the Location Shape is top north west corner (i.e., 0,0) of the floor plan that on which the Location Shape is defined.

The format of the Location Shape subelement is shown in Figure 8-171.

![Figure 8-171—Location Shape subelement format](image)

The Location Shape subelement defines the position in meters, including uncertainty, of the entity being located. A Shape is specified with respect to either a 2-Dimensional or 3-Dimensional Coordinate Reference System where each point in the shape defines the direction from the Location Reference starting point. A positive X-axis value corresponds to an easterly direction relative to the Location Reference; a negative X-axis value corresponds to a westerly direction relative to the Location Reference; a positive Y-axis value corresponds to a northerly direction relative to the Location Reference; a negative Y-axis value corresponds to a southerly direction relative to the Location Reference and the Z-axis value corresponds to the altitude above the horizontal plane at the Location Reference.

The Location Shape ID field contains a one-octet identifier that defines the shape contained in the subelement and is one of the values defined in Table 8-96.

<table>

</table>

The Location Shape Value field contains the location shape value for each corresponding Location Shape ID. The formats of Location Shape Values are described in the following text.
All shape field value units that are 4-octet single precision floating point values are in meters and are represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field.

The format of the 2-Dimension Point Location Shape Value is defined in Figure 8-172.

![Figure 8-172—2-Dimension Point Location Shape Value format](image)

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The format of the 3-Dimension Point Location Shape Value is defined in Figure 8-173.

![Figure 8-173—3-Dimension Point Location Shape Value format](image)

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The format of the Circle Location Shape Value is defined in Figure 8-174.

![Figure 8-174—Circle Location Shape Value format](image)

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Sphere Location Shape Value is defined in Figure 8-175.

![Figure 8-175—Sphere Location Shape Value format](image)

The X-coordinate field contains a 4-octet single precision floating point value.
The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Polygon Location Shape Value is defined in Figure 8-176.

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the polygon. The value 0 is reserved.

The List of 2-Dimension Points is a sequence of 2D Point field values that define the closed polygon.

The format of the Prism Location Shape Value is defined in Figure 8-177.

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the prism. The value 0 is reserved.

The List of 3-Dimension Points is a sequence of 3-Dimension Point field values that define the closed prism.

The format of the Ellipse Location Shape Value is defined in Figure 8-178.

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains a 2-octet unsigned integer between 0 and 359 degrees.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.
The format of the Ellipsoid Location Shape Value is defined in Figure 8-179.

<table>
<thead>

</tr>
</tbody>
</table>

**Figure 8-181—Map Image subelement format**

The Map Type field is a 1-octet unsigned integer that defines the type of map referred to by the Map URL field, as defined in Table 8-97.
The Map Type field value “URL Defined” indicates the Map URL field value has a file extension, defined as a mime type and is self-descriptive.

The Map URL field is a variable-length field formatted in accordance with IETF RFC 3986-2005 and provides the location of a floor map.

The Civic Location field of the Location Civic Report (see Figure 8-169) is a variable octet field and contains the location information in the format as indicated in the Civic Location Type field.

### 8.4.2.24.14 Location Identifier Report

The Location Identifier Report includes an indirect reference to the location information for the location subject provided in the Location Identifier measurement request, as shown in Figure 8-182.

<table>
<thead>
<tr>

</tbody>
</table>

The expiration TSF is optional.

The figure depicts the Location Identifier Report field format.

---

Table 8-97—Map Types
The Expiration TSF field is the value of the TSF when the Public Identifier URI field value is no longer valid. The Expiration TSF field set to 0 indicates the Public Identifier URI does not expire.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-98. A Yes in the Extensible column of a subelement listed in Table 8-98 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

### Table 8-98—Optional subelement IDs for Location Identifier Report

<td></td>
</tr>
</tbody>
</table>

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding Location Identifier Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding Location Identifier Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The Public Identifier URI field contains a value in URI format that points to a location object. It can be used to return the location value for the requesting STA. The format of the location value returned when the URI is dereferenced is dependent on the provider of the URI and is beyond the scope of this document. The Public Identifier URI confirms the validity of the location estimate to an external agent when a STA forwards a location estimate to that agent. The protocol used to query the infrastructure for a location report based on the Public Identifier URI is beyond the scope of this standard.

### 8.4.2.25 Quiet element

The Quiet element defines an interval during which no transmission occurs in the current channel. This interval may be used to assist in making channel measurements without interference from other STAs in the BSS. The format of the Quiet element is shown in Figure 8-183.
The Length field is set to 6.

The Quiet Count field is set to the number of TBTTs until the beacon interval during which the next quiet interval starts. A value of 1 indicates the quiet interval starts during the beacon interval starting at the next TBTT. A value of 0 is reserved.

The Quiet Period field is set to the number of beacon intervals between the start of regularly scheduled quiet intervals defined by this Quiet element. A value of 0 indicates that no periodic quiet interval is defined.

The Quiet Duration field is set to the duration of the quiet interval, expressed in TUs.

The Quiet Offset field is set to the offset of the start of the quiet interval from the TBTT specified by the Quiet Count field, expressed in TUs. The value of the Quiet Offset field is less than one beacon interval.

The Quiet element may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Quiet elements is described in 10.9.3.

### 8.4.2.26 IBSS DFS element

The IBSS DFS element contains information for DFS operation in an IBSS. The format of the IBSS DFS element is shown in Figure 8-184.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>DFS Owner</th>
<th>DFS Recovery Interval</th>
<th>Channel Map (see Figure 8-185)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>2×n</td>
</tr>
</tbody>
</table>

**Figure 8-184—IBSS DFS element format**

The Length field is variable.

The DFS Owner field is set to the individual IEEE MAC address of the STA that is the currently known DFS Owner in the IBSS.

The DFS Recovery Interval field indicates the time interval that is used for DFS owner recovery, expressed as an integral number of beacon intervals. The DFS Recovery Interval value is static throughout the lifetime of the IBSS and is determined by the STA that starts the IBSS.

The Channel Map field shown in Figure 8-185 contains a Channel Number field and a Map field (see 8.4.2.24.2) for each channel supported by the STA transmitting the IBSS DFS element. Note that n in
Figure 8-184 is the number of channels supported by the STA.

The IBSS DFS element may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of IBSS DFS elements is described in 10.9.8.3.

8.4.2.27 RSNE

8.4.2.27.1 General

The RSNE contains authentication and pairwise cipher suite selectors, a single group data cipher suite selector, an RSN Capabilities field, the PMK identifier (PMKID) count, a PMKID list, and a single group management cipher suite selector. See Figure 8-186. The size of the RSNE is limited by the size of an element, which is 255 octets. Therefore, the number of pairwise cipher suites, AKM suites, and PMKIDs is limited.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>1</th>
<th>1</th>
<th>2</th>
<th>4</th>
<th>2</th>
<th>4 × m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element ID</td>
<td>Length</td>
<td>Version</td>
<td>Group Data Cipher Suite</td>
<td>Pairwise Cipher Suite Count</td>
<td>Pairwise Cipher Suite List</td>
<td></td>
</tr>
</tbody>
</table>

In Figure 8-186, \( m \) denotes the pairwise cipher suite count, \( n \) the AKM suite count, and \( s \) is the PMKID count.

All fields use the bit convention from 8.2.2. The RSNE contains up to and including the Version field. All fields after the Version field are optional. If any nonzero length field is absent, then none of the subsequent fields is included.

Element ID is set to the value for RSN, specified in Table 8-54.

Length gives the number of octets in the Information field (field(s) following the Element ID and Length fields) of the element.

The Version field indicates the version number of the RSNA protocol. The range of Version field values a STA supports is contiguous. Values 0 and 2 or higher of the Version field are reserved. RSN Version 1 is defined in this standard.

NOTE—The following represent sample elements:

802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP not allowed):

30, // element id, 48 expressed as Hex value
14, // length in octets, 20 expressed as Hex value
01 00, // Version 1
00 0F AC 04, // CCMP as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // 802.1X authentication
00 00 // No capabilities
802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104 and TKIP not allowed), preauthentication supported:

802.1X authentication, Use GTK for pairwise cipher suite, WEP-40 group data cipher suites, optional RSN Capabilities field omitted:

802.1X authentication, Use CCMP for pairwise cipher suite, CCMP group data cipher suites, preauthentication and a PMKID:

802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP are not allowed), and management frame protection with AES-128-CMAC as the group management suite selector.

8.4.2.27 Cipher suites

The Group Data Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed frames.

The Pairwise Cipher Suite Count field indicates the number of pairwise cipher suite selectors that are contained in the Pairwise Cipher Suite List field.

The Pairwise Cipher Suite List field contains a series of cipher suite selectors that indicate the pairwise cipher suites contained in the RSNE.

The Group Management Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed robust management frames.
When management frame protection is negotiated, the negotiated pairwise cipher suite is used to protect individually addressed robust management frames, and the group management cipher suite is used to protect group addressed robust management frames. Use of AES-128-CMAC is not valid as a data cipher suite.

A suite selector has the format shown in Figure 8-187.

<table>
<thead>
<tr>
<th>OUI Suite type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00-0F-AC:0</td>
<td>Use group cipher suite</td>
</tr>
<tr>
<td>00-0F-AC:4</td>
<td>CCMP – default pairwise cipher suite and default group cipher suite for data frames in an RSNA</td>
</tr>
<tr>
<td>00-0F-AC:5</td>
<td>WEP-104</td>
</tr>
<tr>
<td>00-0F-AC:6</td>
<td>BIP—default group management cipher suite in an RSNA with management frame protection enabled</td>
</tr>
<tr>
<td>00-0F-AC:7</td>
<td>Group addressed traffic not allowed</td>
</tr>
<tr>
<td>00-0F-AC:8–255</td>
<td>Reserved</td>
</tr>
<tr>
<td>Vendor OUI</td>
<td>Other Vendor-specific</td>
</tr>
<tr>
<td>Other</td>
<td>Any Reserved</td>
</tr>
</tbody>
</table>

The cipher suite selector 00-0F-AC:4 (CCMP) is the default cipher suite value.

The cipher suite selectors 00-0F-AC:1 (WEP-40) and 00-0F-AC:5 (WEP-104) are only valid as a group cipher suite in a transition security network (TSN) to allow pre-RSNA devices to join an IBSS or to associate with an infrastructure BSS.

Use of any group cipher suite other than TKIP, WEP-104, or WEP-40 with TKIP as the pairwise cipher suite is not supported.

The cipher suite selector 00-0F-AC:0 (Use group cipher suite) is only valid as the pairwise cipher suite. An AP may specify the selector 00-0F-AC:0 (Use group cipher suite) for a pairwise cipher suite if it does not support any pairwise cipher suites. If an AP specifies 00-0F-AC:0 (Use group cipher suite) as the pairwise cipher selection, this is the only pairwise cipher selection the AP advertises.
If any cipher suite other than TKIP, WEP-104, or WEP-40 is enabled, then the AP supports pairwise keys, and thus the suite selector 00-0F-AC:0 (Use group cipher suite) is not a valid option.

Table 8-100 indicates the circumstances under which each cipher suite is used.

### Table 8-100—Cipher suite usage

</tbody>
</table>

### 8.4.2.27.3 AKM suites

The AKM Suite Count field indicates the number of AKM suite selectors that are contained in the AKM Suite List field.

The AKM Suite List field contains a series of AKM suite selectors contained in the RSNE. In an IBSS only a single AKM suite selector may be specified because STAs in an IBSS use the same AKM suite and because there is no mechanism to negotiate the AKMP in an IBSS (see 11.5.5).

Each AKM suite selector specifies an AKMP. Table 8-101 gives the AKM suite selectors defined by this standard. An AKM suite selector has the format shown in Figure 8-187.

### Table 8-101—AKM suite selectors

<td>Vendor-specific</td>
</tr>
<tr>
<td>Other</td>
<td>Any</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The AKM suite selector value 00-0F-AC:1 (i.e., Authentication negotiated over IEEE 802.1X with RSNA key management as defined in 11.6 or using PMKSA caching as defined in 11.5.9.3) is the assumed default when the AKM suite selector field is not supplied.

NOTE—The selector value 00-0F-AC:1 specifies only that IEEE Std 802.1X-2004 is used as the authentication transport. IEEE Std 802.1X-2004 selects the authentication mechanism.

The AKM suite selector value 00-0F-AC:8 (i.e., SAE Authentication with SHA-256 or using PMKSA caching as defined in 11.5.9.3 with SHA-256 key derivation) is used when either a password or PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:8 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:2 (PSK) is used when an alternate form of PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:2 can simultaneously be enabled by an Authenticator.
8.4.2.27.4 RSN capabilities

The RSN Capabilities field indicates requested or advertised capabilities. If the RSN Capabilities field is not present, the default value of 0 is used for all the capability subfields.

The length of the RSN Capabilities field is 2 octets. The format of the RSN Capabilities field is as illustrated in Figure 8-188 and described after the figure.

<table>
<thead>
<tr>

<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

---
- Bit 0: Preauthentication. An AP sets the Preauthentication subfield of the RSN Capabilities field to 1 to signal it supports preauthentication (see 11.5.9.2) and sets the subfield to 0 when it does not support preauthentication. A non-AP STA sets the Preauthentication subfield to 0.
- Bit 1: No Pairwise. If a STA supports WEP default key 0 simultaneously with a pairwise key (see 11.6.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 0. If a STA does not support WEP default key 0 simultaneously with a pairwise key (see 11.6.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 1. The No Pairwise subfield describes a capability of a non-AP STA. STAs in an IBSS and APs set the No Pairwise subfield to 0. The No Pairwise subfield is set to 1 only in a TSN and when the pairwise cipher suite selected by the STA is TKIP.
- Bits 2–3: PTKSA Replay Counter. A STA sets the PTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberofPTKSAReplayCounters. The least significant bit (LSB) of dot11RSNAConfigNumberofPTKSAReplayCounters is put in bit 2. See 11.4.2.6 and 11.4.3.4.4. The meaning of the value in the PTKSA/GTKSA/STKSA Replay Counter subfield is defined in Table 8-102. The number of replay counters per STKSA is the same as the number of replay counters per PTKSA.

**Table 8-102—PTKSA/GTKSA/STKSA replay counters usage**

<table>
<thead>
<tr>
<th>Replay counter value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1 replay counter per PTKSA/GTKSA/STKSA</td>
</tr>
<tr>
<td>1</td>
<td>2 replay counters per PTKSA/GTKSA/STKSA</td>
</tr>
<tr>
<td>2</td>
<td>4 replay counters per PTKSA/GTKSA/STKSA</td>
</tr>
<tr>
<td>3</td>
<td>16 replay counters per PTKSA/GTKSA/STKSA</td>
</tr>
</tbody>
</table>
— Bits 4–5: GTKSA Replay Counter. A STA sets the GTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberOfPTKSAReplayCounters. The LSB of dot11RSNAConfigNumberOfGTKSAReplayCounters is put in bit 4. See 11.4.2.6 and 11.4.3.4.4. The meaning of the value in the GTKSA Replay Counter subfield is defined in Table 8-102.

— Bit 6: Management Frame Protection Required (MFPR). A STA sets this bit to 1 to advertise that protection of robust management frames is mandatory. A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated and dot11RSNAUnprotectedManagementFramesAllowed is false; otherwise it sets this bit to 0. If a STA sets this bit to 1, then that STA only allows RSNAs with STAs that provide Management Frame Protection.

— Bit 7: Management Frame Protection Capable (MFPC). A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true to advertise that protection of robust management frames is enabled.

— Bits 9: PeerKey Enabled. An AP STA sets the PeerKey Enabled subfield of the RSN Capabilities field to 1 to signal it supports PeerKey Handshake (see 11.6.8). This field is used by AP STA to describe its ability to support PeerKey Handshake.

— Bit 10: SPP A-MSDU Capable. A STA sets the SPP A-MSDU Capable subfield of the RSN Capabilities field to 1 to signal that it supports signaling and payload protected A-MSDUs (SPP A-MSDUs) (see 10.18). Otherwise, this subfield is set to 0.

— Bit 11: SPP A-MSDU Required. A STA sets the SPP A-MSDU Required subfield of the RSN Capabilities field to 1 when it allows only SPP A-MSDUs (i.e., does not send or receive payload protected A-MSDUs (PP A-MSDUs) (see 10.18). Otherwise, this subfield is set to 0.

— Bit 12: PBAC (protected block ack agreement capable). A STA sets the PBAC subfield of RSN Capabilities field to 1 to indicate it supports PBAC. Otherwise, this subfield is set to 0.

— Bit 13: Extended Key ID for Individually Addressed Frames. This subfield is set to 1 to indicate that the STA supports Key ID values in the range 0 to 1 for a PTKSA and STKSA when the cipher suite is CCMP. A value of 0 indicates that the STA only supports Key ID 0 for a PTKSA and STKSA.

— Bits 8 and 14–15: Reserved. The remaining subfields of the RSN Capabilities field are reserved.

### 8.4.2.27.5 PMKID

The PMKID Count and List fields are used only in the RSNE in the (Re)Association Request frame to an AP and in FT authentication sequence frames. The PMKID Count specifies the number of PMKIDs in the PMKID List field. The PMKID list contains 0 or more PMKIDs that the STA believes to be valid for the destination AP. The PMKID can refer to

- a) A cached PMKSA that has been obtained through preauthentication with the target AP
- b) A cached PMKSA from an EAP or SAE authentication
- c) A PMKSA derived from a PSK for the target AP
- d) A PMK-R0 security association derived as part of an FT initial mobility domain association
- e) A PMK-R1 security association derived as part of an FT initial mobility domain association or as part of a fast BSS transition.

See 11.6.1.3 for the construction of the PMKID, 12.8 for the population of PMKID for fast BSS transitions, and 11.6.1.7 for the construction of PMKR0Name and PMKR1Name.

**NOTE**—A STA need not insert a PMKID in the PMKID List field if the STA will not be using that PMKSA.
8.4.2.28 Vendor Specific element

The Vendor Specific element is used to carry information not defined in this standard within a single defined format, so that reserved element IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 8-189 and requires that the first 3 or more octets of the Information field identify the entity that has defined the content of the particular Vendor Specific element. The length of the Organization Identifier field (see 8.4.1.31) is \( j \) octets, and the order of this field is described in 8.2.2. The length of the Information field \( n \) is constrained by \( j \leq n \leq 255 \). The length of the vendor-specific content is \( n-j \) octets.

![Figure 8-189—Vendor Specific element format](insert_image)

Multiple Vendor Specific elements are optionally present in a single frame. Each Vendor Specific element might have a different Organization Identifier value. The number of Vendor Specific elements that may appear in a frame is limited only by the maximum frame size.

8.4.2.29 Extended Capabilities element

The Extended Capabilities element carries information about the capabilities of an IEEE 802.11 STA that augment the Capability Information field (CIF). The format of this element is shown in Figure 8-190.

![Figure 8-190—Extended Capabilities element format](insert_image)

The Element ID field is set to the value for Extended Capabilities, specified in Table 8-54.

The value of the Length field is equal to the number of octets in the Capabilities field.

The Capabilities field is a bit field indicating the capabilities being advertised by the STA transmitting the element. The length of the Capabilities field is a variable \( n \). The Capabilities field is shown in Table 8-103.

When dot11RejectUnadmittedTraffic is not present, the Reject Unadmitted frame bit is set to 0.</td>
</tr>
</tbody>
</table>
If a STA does not support any of capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

NOTE—The fields of the Extended Capabilities element are not dynamic. They are determined by the parameters of the MLME-START.request or MLME-JOIN.request primitive that caused the STA to start or join its current BSS, and they remain unchanged until the next MLME-START.request or MLME-JOIN.request primitive.

### 8.4.2.30 BSS Load element

The BSS Load element contains information on the current STA population and traffic levels in the BSS. The element information format is defined in Figure 8-191. This element may be used by the STA for vendor-specific AP selection algorithm when roaming.

<table>

</tr>
</tbody>
</table>

If a STA does not support any of capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

The STA Count field is interpreted as an unsigned integer that indicates the total number of STAs currently associated with this BSS.

---

Table 8-103—Capabilities field (continued)
The Channel Utilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy, as indicated by either the physical or virtual carrier sense (CS) mechanism. When more than one channel is in use for the BSS, the Channel Utilization field value is calculated only for the primary channel. This percentage is computed using the formula,

\[
\text{Channel Utilization} = \text{Integer}\left(\frac{\text{channel busy time}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024}\right) \times 255,
\]

where

- channel busy time is defined to be the number of microseconds during which the CS mechanism, as defined in 9.3.2.1, has indicated a channel busy indication,
- dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the channel busy time is measured. The default value of dot11ChannelUtilizationBeaconIntervals is defined in Annex C.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the remaining amount of medium time available via explicit admission control, in units of 32 μs/s. The field is helpful for roaming STAs to select an AP that is likely to accept future admission control requests, but it does not represent an assurance that the HC admits these requests.

### 8.4.2.31 EDCA Parameter Set element

The EDCA Parameter Set element provides information needed by STAs for proper operation of the QoS facility during the CP. The format of the EDCA Parameter Set element is defined in Figure 8-192.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length (18)</th>
<th>QoS Info</th>
<th>Reserve d</th>
<th>AC_BE Parameter Record</th>
<th>AC_BK Parameter Record</th>
<th>AC_VI Parameter Record</th>
<th>AC_VO Parameter Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

**Figure 8-192—EDCA Parameter Set element**

For an infrastructure BSS, the EDCA Parameter Set element is used by the AP to establish policy (by changing default MIB attribute values), to change policies when accepting new STAs or new traffic, or to adapt to changes in offered load. The most recent EDCA parameter set element received by a STA is used to update the appropriate MIB values.

The format of the QoS Info field is defined in 8.4.1.17. The QoS Info field contains the EDCA Parameter Set Update Count subfield, which is initially set to 0 and is incremented each time any of the AC parameters changes. This subfield is used by non-AP STAs to determine whether the EDCA parameter set has changed and requires updating the appropriate MIB attributes.

The formats of AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record fields are identical and are illustrated in Figure 8-193.

<table>
<thead>
<tr>
<th>ACI / AIFSN</th>
<th>ECWmin / ECWmax</th>
<th>TXOP Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-193—AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record field format**
The format of the ACI/AIFSN field is illustrated in Figure 8-194.

```
+-----------------+---------+-------+-------+-------+
| B0   | B3   | B4   | B5   | B6   | B7   |
+-----------------+---------+-------+-------+-------+
| AIFSN           | ACM     | ACI   | Reserved |
+-----------------+---------+-------+-------+
```

**Figure 8-194—ACI/AIFSN field**

The value of the AC index (ACI) references the AC to which all parameters in this record correspond. The mapping between ACI and AC is defined in Table 8-104. The ACM (admission control mandatory) subfield indicates that admission control is required for the AC. If the ACM subfield is equal to 0, then there is no admission control for the corresponding AC. If the ACM subfield is set to 1, admission control has to be used prior to transmission using the access parameters specified for this AC. The AIFSN subfield indicates the number of slots after a SIFS duration a STA should defer before either invoking a backoff or starting a transmission. The minimum value for the AIFSN subfield is 2.

<table>
<thead>
<tr>
<th>ACI</th>
<th>AC</th>

<td>AC_VI</td>
<td>Video</td>
</tr>
<tr>
<td>11</td>
<td>AC_VO</td>
<td>Voice</td>
</tr>
</tbody>
</table>

**Table 8-104—ACI-to-AC coding**

The ECWmin and ECWmax fields are illustrated in Figure 8-195.

```
+---------+---------+
| B0   | B3   |
+---------+---------+
| ECWmin | ECWmax |
+---------+---------+
```

**Figure 8-195—ECWmin and ECWmax fields**

The ECWmin and ECWmax fields encode the values of CWmin and CWmax, respectively, in an exponent form. The ECWmin and ECWmax values are defined so that

\[
\begin{align*}
\text{CWmin} &= 2^{\text{ECWmin}} - 1 \\
\text{CWmax} &= 2^{\text{ECWmax}} - 1
\end{align*}
\]

Hence the minimum encoded value of CWmin and CWmax is 0, and the maximum value is 32 767.

The value of the TXOP Limit field is specified as an unsigned integer, with the least significant octet transmitted first, in units of 32 μs. A TXOP Limit field value of 0 has a special meaning (see 9.19.2.2).

Table 8-105 defines the default EDCA parameter values used by a non-AP STA if dot11OCBActivated is false.
If dot11OCBActivated is true, the default EDCA parameter set for STAs transmitting QoS frames is given in Table 8-106.

### Table 8-106—Default EDCA parameter set for STA operation if dot11OCBActivated is true

#### 8.4.2.32 TSPEC element

The TSPEC element contains the set of parameters that define the characteristics and QoS expectations of a traffic flow, in the context of a particular STA, for use by the HC and STA(s) in support of QoS traffic transfer using the procedures defined in 10.4. The element information format comprises the items as defined in this subclause, and the structure is defined in Figure 8-196.

---

22The default values for TXOP limit are expressed in milliseconds and are multiples of 32 μs.
The TSPEC allows a set of parameters more extensive than may be needed, or may be available, for any particular instance of parameterized QoS traffic. Unless indicated otherwise, fields that follow the TS Info field are set to 0 for any unspecified parameter values. STAs set the value of any parameters to unspecified if they have no information for setting that parameter. The HC may change the value of parameters that have been set unspecified by the STA to any value that it deems appropriate, including leaving them unspecified.

The structure of the TS Info field is defined in Figure 8-197.

<table>
<thead>
<tr>
<th>Bits:</th>

</tr>
</tbody>
</table>

**Figure 8-197—TS Info field**

The subfields of the TS Info field are defined as follows:

- The Traffic Type subfield is a single bit and is set to 1 for a periodic traffic pattern (e.g., isochronous TS of MSDUs or A-MSDUs, with constant or variable sizes, that are originated at fixed rate) or set to 0 for an aperiodic, or unspecified, traffic pattern (e.g., asynchronous TS of low-duty cycles).
- The TSID subfield is 4 bits in length and contains a value that is a TSID. Note that the MSB (bit 4 in TS Info field) of the TSID subfield is always set to 1.
- The Direction subfield specifies the direction of data carried by the TS as defined in Table 8-107.
- The Access Policy subfield is 2 bits in length, specifies the access method to be used for the TS, and is defined in Table 8-108.

**Table 8-107—Direction subfield encoding**

<table>
<thead>
<tr>

</tr>
<tr>
<td>1</td>
<td>1</td>
<td>HCCA, EDCA mixed mode (HEMM)</td>
</tr>
</tbody>
</table>

- The Aggregation subfield is 1 bit in length. The Aggregation subfield is valid only when access method is HCCA or when the access method is EDCA and the Schedule subfield is equal to 1. It is
set to 1 by a non-AP STA to indicate that an aggregate schedule is required. It is set to 1 by the AP if an aggregate schedule is being provided to the STA. It is set to 0 otherwise. In all other cases, the Aggregation subfield is reserved.

— The APSD subfield is a single bit and is set to 1 to indicate that automatic PS delivery is to be used for the traffic associated with the TSPEC and set to 0 otherwise.

— The UP subfield is 3 bits and indicates the actual value of the UP to be used for the transport of MSDUs or A-MSDUs belonging to this TS in cases where relative prioritization is required. When the TCLAS element is present in the request, the UP subfield in TS Info field of the TSPEC element is reserved.

— The TS Info Ack Policy subfield is 2 bits in length and indicates whether MAC acknowledgments are required for MPDUs or A-MSDUs belonging to this TID and the desired form of those acknowledgments. The encoding of the TS Info Ack Policy subfield is shown in Table 8-109.

| 1      | 0      | No Ack: The recipient(s) do not acknowledge the transmission. |
| 0      | 1      | Reserved |
| 1      | 1      | Block Ack: A separate Block Ack setup mechanism described in 9.21 is used. |

— The Schedule subfield is 1 bit in length and specifies the requested type of schedule. The setting of the subfield when the access policy is EDCA is shown in Table 8-110. When the Access Policy subfield is equal to any value other than EDCA, the Schedule subfield is reserved. When the Schedule and APSD subfields are equal to 1, the AP sets the aggregation bit to 1, indicating that an aggregate schedule is being provided to the STA.

</tbody>
</table>

The Nominal MSDU Size field is 2 octets long, contains an unsigned integer that specifies the nominal size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC, and is defined in Figure 8-198. If the Fixed subfield is equal to 1, then the size of the MSDU or A-MSDU is fixed and is indicated by the Size subfield. If the Fixed subfield is equal to 0, then the size of the MSDU or A-MSDU might not be fixed and the Size subfield indicates the nominal MSDU size. If both the Fixed and Size subfields are equal to 0, then the nominal MSDU size is unspecified.
The Maximum MSDU Size field is 2 octets long and contains an unsigned integer that specifies the maximum size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC.

The Minimum Service Interval field is 4 octets long and contains an unsigned integer that specifies the minimum interval, in microseconds, between the start of two successive SPs.

The Maximum Service Interval field is 4 octets long and contains an unsigned integer that specifies the maximum interval, in microseconds, between the start of two successive SPs.

The Inactivity Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that may elapse without arrival or transfer of an MPDU belonging to the TS before this TS is deleted by the MAC entity at the HC.

The Suspension Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that may elapse without arrival or transfer of an MSDU belonging to the TS before the generation of successive QoS(+)CF-Poll is stopped for this TS. A value of 4 294 967 295 (= $2^{32} - 1$) disables the suspension interval, indicating that polling for the TS is not to be interrupted based on inactivity. The value of the suspension interval is always less than or equal to the inactivity interval.

The Service Start Time field is 4 octets and contains an unsigned integer that specifies the time, expressed in microseconds, when the first scheduled SP starts. The service start time indicates to the AP the time when a STA first expects to be ready to send frames and a power-saving STA needs to be awake to receive frames. This may help the AP to schedule service so that the MSDUs encounter small delays in the MAC and help the power-saving STAs to reduce power consumption. The field represents the four lower order octets of the TSF timer at the start of the SP. If APSD subfield is 0, this field is also set to 0 (unspecified).

The Minimum Data Rate field is 4 octets long and contains an unsigned integer that specifies the lowest data rate specified at the MAC_SAP, in bits per second, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The minimum data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

The Mean Data Rate field is 4 octets long and contains an unsigned integer that specifies the average data rate specified at the MAC_SAP, in bits per second, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The mean data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

The Peak Data Rate field is 4 octets long and contains an unsigned integer that specifies the maximum allowable data rate, in bits per second, for transfer of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. If $p$ is the peak rate in bits per second, then the maximum amount of data, belonging to this TS, arriving in any time interval $[t_1, t_2]$, where $t_1 < t_2$ and $t_2 - t_1 > 1$ TU, does not exceed $p \times (t_2 - t_1)$ bits.

---

Figure 8-198—Nominal MSDU Size field

<table>
<thead>
<tr>
<th>Bits:</th>
<th>15</th>
<th>1</th>
</tr>
</thead>
</table>

The mean data rate, the peak data rate, and the burst size are the parameters of the token bucket model, which provides standard terminology for describing the behavior of a traffic source. The token bucket model is described in IETF RFC 2212-1997 [B27], IETF RFC 2215-1997 [B28], and IETF RFC 3290-2002 [B33].
The Burst Size field is 4 octets long and contains an unsigned integer that specifies the maximum burst, in octets, of the MSDUs or A-MSDUs belonging to this TS that arrive at the MAC_SAP at the peak data rate. A value of 0 indicates that there are no bursts.

The Delay Bound field is 4 octets long and contains an unsigned integer that specifies the maximum amount of time, in microseconds, allowed to transport an MSDU or A-MSDU belonging to the TS in this TSPEC, measured between the time marking the arrival of the MSDU, or the first MSDU of the MSUs constituting an A-MSDU, at the local MAC sublayer from the local MAC_SAP and the time of completion of the successful transmission or retransmission of the MSDU or A-MSDU to the destination. The completion of the MSDU or A-MSDU transmission includes the relevant acknowledgment frame transmission time, if present.

The Minimum PHY Rate field is 4 octets long and contains an unsigned integer that specifies the desired minimum PHY rate to use for this TS, in bits per second, that is required for transport of the MSDUs or A-MSDUs belonging to the TS in this TSPEC. See 10.4.2 for constraints on the selection of this field.

The Surplus Bandwidth Allowance field is 2 octets long and specifies the excess allocation of time (and bandwidth) over and above the stated application rates required to transport an MSDU or A-MSDU belonging to the TS in this TSPEC. This field is represented as an unsigned binary number and, when specified, is greater than 0. The 13 least significant bits (LSBs) indicate the decimal part while the three MSBs indicate the integer part of the number. This field takes into account the retransmissions, as the rate information does not include retransmissions. It represents the ratio of over-the-air bandwidth (i.e., time that the scheduler allocates for the transmission of MSDUs or A-MSDUs at the required rates) to bandwidth of the transported MSDUs or A-MSDUs required for successful transmission (i.e., time that would be necessary at the minimum PHY rate if there were no errors on the channel) to meet throughput and delay bounds under this TSPEC, when specified. As such, it should be greater than unity. A value of 1 indicates that no additional allocation of time is requested.

The Medium Time field is a 16-bit unsigned integer and contains the amount of time admitted to access the medium, in units of 32 μs/s. This field is reserved in the ADDTS Request frame and is set by the HC in the ADDTS Response frame. The derivation of this field is described in N.2.2. This field is not used for controlled channel access.

The UP, Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, Minimum PHY Rate, and Delay Bound fields in a TSPEC element express the QoS expectations requested by a STA, if this TSPEC was issued by that STA, or provided by the HC, if this TSPEC was issued by the HC, when these fields are specified with nonzero values. Unspecified parameters in these fields as indicated by a value of 0 indicate that the STA does not have specific requirements for these parameters if the TSPEC was issued by that STA or that the HC does not provide any specific values for these parameters if the TSPEC was issued by the HC.

8.4.2.33 TCLAS element

The TCLAS element specifies an element that contains a set of parameters necessary to identify incoming MSDUs (from a higher layer in all STAs or from the DS in an AP) that belong to a particular TS. The TCLAS element is also used when the traffic does not belong to a TS, for example, by the FMS, DMS, and TFS services. If required, the TCLAS element is provided in ADDTS Request and ADDTS Response frames only for the downlink or bidirectional links. TCLAS element need not be provided for the uplink or direct-link transmissions. The structure of this element is shown in Figure 8-199.

---

24This rate information is intended to confirm that the TSPEC parameter values resulting from an admission control negotiation are sufficient to provide the required throughput for the TS. In a typical implementation, a TS is admitted only if the defined traffic volume can be accommodated at the specified rate within an amount of WM occupancy time that the admissions control entity is willing to allocate to this TS.
The UP field contains the value of the UP of the associated MSDUs.

The Frame Classifier field is 3–255 octets in length and is defined in Figure 8-200.

</tr>
</tbody>
</table>

The Classifier Mask subfield specifies a bitmap in which bits that have the value 1 identify a subset of the classifier parameters whose values need to match those of the corresponding parameters in a given MSDU for that MSDU to be classified to the TS of the affiliated TSPEC. The bitmap is ordered from the LSB to the MSB, with each bit pointing to one of the classifier parameters of the same relative position as shown in this subclause based on classifier type. An incoming MSDU that failed to be classified to a particular TS may be classified to another active TS based on the frame classifier for that TS. If, however, all the frame classifiers for the active TS have been exhausted, the MSDU does not belong to any active TS and is classified to be a best-effort MSDU. In cases where there are more bits in the bitmap than classifier parameters that follow, the MSBs that do not point to any classifier parameters are reserved.

For Classifier Type 0, the classifier parameters are the following parameters contained in an Ethernet packet header: Source Address, Destination Address, and Type ("Ethernet" [B12]). The endianness of the Type field is as defined in Ethernet [B12]. The Frame Classifier field for Classifier Type 0 is defined in Figure 8-201. It has a length of 16 octets.
For Classifier Type 1, frame classifier is defined for both IPv4 and IPv6, shown in Figure 8-202 and Figure 8-203, and distinguished by the Version field. Use of Classifier Type 1 for IPv6 is deprecated and replaced by Classifier Type 4. The subfields in the classifier parameters are represented and transmitted in the big-endian format. The classifier parameters are the following parameters:

- In a TCP or UDP header: Source Address, Destination Address, Source Port, Destination Port, and Version, plus
- One of the following:
  - In an IPv4 header: Differentiated Services Code Point (DSCP) (IETF RFC 2474-1998 [B29]) and Protocol, or
  - In an IPv6 header: Flow Label.

The DSCP field contains the value in the 6 LSBs, and the 2 MSBs are set to 0. The 2 MSBs of the DSCP field are ignored for frame classification.

For Classifier Type 2, the Classifier Parameter is the IEEE 802.1Q-2003 [B22] VLAN Tag TCI. The endianness of the 802.1Q VLAN TCI field is as defined IEEE 802.1Q-2003 [B22] for the VLAN Tag TCI. The Frame Classifier field for Classifier Type 2 is defined in Figure 8-204.

For Classifier Type 3, the classifier parameters are defined by a Filter Offset subfield, a Filter Value subfield and a Filter Mask subfield. The Frame Classifier subfield of Classifier Type 3 is defined in Figure 8-205. It has a variable length.
The Classifier Mask subfield is reserved.

The value of the Filter Offset subfield is the number of octets from the beginning of the MSDU or MMPDU at which the Filter Value is compared. A value of 0 for the Filter Offset indicates that the Filter Value subfield is to be compared to the first octet of the payload prior to encryption following the MAC header.

The length of the Filter Value and Filter Mask subfields is \((\text{Length} – 5)/2\), where \(\text{Length}\) is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU or MMDPU content, beginning at the octet indicated by the Filter Offset.

The Filter Mask subfield is an octet string that is used to indicate which bits in the Filter Value subfield are compared. The length of the Filter Mask subfield is equal to the length of the Filter Value subfield. A bit in the Filter Value subfield is only compared if the matching bit in the Filter Mask subfield is 1.

For Classifier Type 4, frame classifier is defined for both IPv4 and IPv6, shown in Figure 8-206 (with the Classifier Type subfield set to 4) and Figure 8-207, and distinguished by the Version subfield. The classifier parameters represent corresponding values in a received IPv4 or IPv6 frame and are defined in Table 8-112. The subfields in the classifier parameters are represented and transmitted in big-endian format.

</table>

Figure 8-207—Frame Classifier subfield of Classifier Type 4 for traffic over IPv6

NOTE—Frame classification when extension headers are used is supported only if the TCLAS does not classify on ports (Classifier Mask has the Source and Destination Port bits set to 0).

The DSCP subfield contains the value as described in IETF RFC 2474-1998 in the 6 least significant bits. The 2 most significant bits are reserved.

The Next Header subfield contains the next encapsulated protocol and is compatible with the values specified for the IPv4 Protocol subfield. In the presence of options in the IPv6 header, the Next Header subfield specifies the presence of one or more out of six extension headers as defined in IETF RFC 2460-1998.

The Flow Label subfield contains the value in the 20 least significant bits. The 4 most significant bits are reserved.

NOTE—For example, the flow label 0x12345 is represented as the octet sequence 0x01, 0x23, 0x45.

A TCLAS element is valid when the Classifier Mask Version bit is 1.

For Classifier Type 5, the classifier parameters are the following parameters in an IEEE 802.1Q-2003 [B22] tag header: Priority Code Point (PCP; equivalent to IEEE 802.1D-2004 [B20] User Priority), Canonical Format Indicator (CFI), and VLAN ID (VID).
The Frame Classifier field for Classifier Type 5 is defined in Figure 8-208.

<table>
<thead>
<tr>
<th>Classifier Type (4)</th>

<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-208—Frame Classifier field of Classifier Type 5**

The subfields in the classifier parameters are represented and transmitted in big-endian format.

The PCP subfield contains the value in the 4 LSBs; the 4 MSBs are reserved.

The CFI subfield contains the value in the LSB; the 7 MSBs are reserved.

The VID subfield contains the value in the 12 LSBs; the 4 MSBs are reserved.

**8.4.2.34 TS Delay element**

The TS Delay element is used in the ADDTS Response frame transmitted by the HC and indicates the time after which the ADDTS may be retried. The TS Delay element is defined in Figure 8-209.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length (4)</th>
<th>Delay</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-209—TS Delay element**

The Delay field is 4 octets long and specifies the amount of time, in TUs, a STA should wait before it reinitiates setup of a TS.

The Delay field is set to 0 when an AP does not expect to serve any TSPECs for an indeterminate time and does not know this time a priori.

**8.4.2.35 TCLAS Processing element**

The TCLAS Processing element is present in the ADDTS Request, ADDTS Response, FMS Request, DMS Request, and TFS Request frames if there are multiple TCLASs associated with the request. It indicates how an MSDU received from higher layers should be processed by the classifier. The TCLAS Processing element is defined in Figure 8-210.

<table>

<tr>
<td>3–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

#### 8.4.2.36 Schedule element

The Schedule element is transmitted by the HC to a STA to announce the schedule that the HC/AP follows for admitted streams originating from or destined to that STA in the future. The information in this element may be used by the STA for power management, internal scheduling, or any other purpose. The element information format is shown in Figure 8-211.

![Figure 8-211—Schedule element](image)

The Schedule Info field is shown in Figure 8-212.

![Figure 8-212—Schedule Info field](image)

The Aggregation subfield is set to 1 if the schedule is an aggregate schedule for all TSIDs associated with the STA to which the frame is directed. It is set to 0 otherwise. The TSID subfield is as defined in 8.2.4.5.2 and indicates the TSID for which this schedule applies. The Direction subfield is as defined in 8.4.2.32 and defines the direction of the TSPEC associated with the schedule. The TSID and Direction subfields are valid only when the Aggregation subfield is 0. If the Aggregation subfield is 1, the TSID and Direction subfields are reserved.

The Service Start Time field is 4 octets and indicates the anticipated time, expressed in microseconds, when service starts and represents the lower order 4 octets of the TSF timer value at the start of the first SP. The AP uses this field to confirm or modify the service start time indicated in the TSPEC request.

The Service Interval field is 4 octets and indicates the time, expressed in microseconds, between two successive SPs and represents the measured time from the start of one SP to the start of the next SP.
The Specification Interval field is 2 octets long and contains an unsigned integer that specifies the time interval, in TUs, to verify schedule conformance.

The HC may set the Service Start Time field and the Service Interval field to 0 (unspecified) for nonpowersaving STAs.

8.4.2.37 QoS Capability element

The QoS Capability element contains a number of subfields that are used to advertise optional QoS capabilities at a QoS STA. The QoS Capability element is present in Beacon frames that do not contain the EDCA Parameter Set element and in (Re)Association Request frames. The QoS Capability element is defined in Figure 8-213.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length (1)</th>
<th>QoS Info</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**Figure 8-213—QoS Capability element format**

The QoS Info field is 1 octet in length and is defined in 8.4.1.17.

8.4.2.38 AP Channel Report element

The AP Channel Report element contains a list of channels where a STA is likely to find an AP. The format of the AP Channel Report element is shown in Figure 8-214. See 10.11.6 for details.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Operating Class</th>
<th>Channel List</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>
```

**Figure 8-214—AP Channel Report element format**

The Element ID field is equal to the AP Channel Report value in Table 8-54.

The Length field in octets is variable and depends on the number of channels reported in the Channel List. The minimum value of the Length field is 1 (based on a minimum length for the channel list field of 0 octets).

Operating Class contains an enumerated value from Annex E, specifying the operating class in which the Channel List is valid. An AP Channel Report only reports channels for a single operating class. Multiple AP Channel Report elements are present when reporting channels in more than one operating class.

The Channel List contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on Operating Class according to Annex E.

8.4.2.39 Neighbor Report element

The format of the Neighbor Report element is shown in Figure 8-215.
The Element ID field is equal to the Neighbor Report value in Table 8-54.

The Length field in octets is variable and depends on the number and length of optional subelements. Each Report element describes an AP and consists of BSSID, BSSID Information, Channel Number, Operating Class, PHY Type, and optionally includes optional subelements. The minimum value of the Length field is 13 (i.e., with no optional subelements in the Neighbor Report element).

The BSSID is the BSSID of the BSS being reported. The subsequent fields in the Neighbor Report element pertain to this BSS.

The BSSID Information field can be used to help determine neighbor service set transition candidates. It is 4 octets in length and contains the subfields as shown in Figure 8-216.

The AP Reachability field indicates whether the AP identified by this BSSID is reachable by the STA that requested the neighbor report. For example, the AP identified by this BSSID is reachable for the exchange of preauthentication frames as described in 11.5.9.2. The values are shown in Table 8-114.

<table>
<thead>
<tr>
<th>Value</th>
<th>Reachability</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
<td>Not used.</td>
</tr>
<tr>
<td>1</td>
<td>Not Reachable</td>
<td>A station sending a preauthentication frame to the BSSID will not receive a response even if the AP indicated by the BSSID is capable of preauthentication.</td>
</tr>
<tr>
<td>2</td>
<td>Unknown</td>
<td>The AP is unable to determine if the value Reachable or Not Reachable is to be returned.</td>
</tr>
<tr>
<td>3</td>
<td>Reachable</td>
<td>The station sending a preauthentication frame to the BSSID can receive a response from an AP that is capable of preauthentication.</td>
</tr>
</tbody>
</table>

The Security bit, if 1, indicates that the AP identified by this BSSID supports the same security provisioning as used by the STA in its current association. If the bit is 0, it indicates either that the AP does not support the same security provisioning or that the security information is not available at this time.
The Key Scope bit, when set, indicates the AP indicated by this BSSID has the same authenticator as the AP sending the report. If this bit is 0, it indicates a distinct authenticator or the information is not available.

The Capabilities Subfield contains selected capability information for the AP indicated by this BSSID. The bit fields within this subfield have the same meaning and are set to the equivalent bits within the Capability Information field (see 8.4.1.4) being sent in the beacons by the AP being reported. The format of the Capabilities subfield is as in Figure 8-217.

<table>
<thead>
<tr>
<th></th>

<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-217—Capabilities subfield**

The Mobility Domain bit is set to 1 to indicate that the AP represented by this BSSID is including an MDE in its Beacon frames and that the contents of that MDE are identical to the MDE advertised by the AP sending the report.

The High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is an HT AP including the HT Capabilities element in its Beacons, and that the contents of that HT Capabilities element are identical to the HT Capabilities element advertised by the AP sending the report.

Bits 12–31 are reserved.

Operating Class indicates the channel set of the AP indicated by this BSSID. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for the AP indicated by this BSSID. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the last known operating channel of the AP indicated by this BSSID. Channel Number is defined within an Operating Class as shown in Annex E.

The PHY Type field indicates the PHY type of the AP indicated by this BSSID. It is an integer value coded according to the value of the dot11PHYType.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-115. A Yes in the Extensible column of a subelement listed in Table 8-115 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

</tbody>
</table>

The TSF Information subelement contains TSF Offset and Beacon Interval subfields as shown in Figure 8-218.

![Figure 8-218—TSF Information subelement format](image)

The value of the TSF Information subelement Length field in octets is 4.

The TSF Offset subfield is 2 octets long and contains the neighbor AP’s TSF timer offset. This is the time difference, in TU units, between the serving AP and a neighbor AP. This offset is given modulo the neighbor AP’s Beacon Interval and rounded to the nearest TU boundary.

The Beacon Interval field is the beacon interval of the Neighbor AP indicated by this BSSID. This field is defined in 8.4.1.3 and illustrated in Figure 8-37.

The Condensed Country String subelement is set to the first two octets of the value contained in dot11CountryString. This subelement is present only if the country of the neighbor AP indicated by the BSSID differs from the country of the AP that sent this neighbor report.
The Measurement Pilot Transmission subelement has the same format as the Measurement Pilot Transmission element (see 8.4.2.44). The Measurement Pilot Interval subelement is not included if the reported AP is not transmitting Measurement Pilot frames or if the Measurement Pilot Interval of the reported AP is unknown.

The HT Capabilities subelement is the same as the HT Capabilities element as defined in 8.4.2.58.

The HT Operation subelement is the same as the HT Operation element as defined in 8.4.2.59.

The Secondary Channel Offset subelement is the same as the Secondary Channel Offset element as defined in 8.4.2.22.

The RM Enabled Capabilities subelement has the same format as the RM Enabled Capabilities element (see 8.4.2.47).

The Multiple BSSID subelement has the same format as the Multiple BSSID element (see 8.4.2.48). The reference BSSID for the Multiple BSSID subelement is the BSSID field in the Neighbor Report element. This subelement is not present if the neighbor AP is not a member of a Multiple BSSID Set with two or more members or its membership is unknown. (see 10.11.14).

The format of the BSS Transition Candidate Preference subelement field is shown in Figure 8-219.

![Figure 8-219—BSS Transition Candidate Preference subelement field format](image)

The value of the Length field in the BSS Transition Candidate Information subelement is 1.

The Preference field indicates the network preference for BSS transition to the BSS listed in this BSS Transition Candidate List Entries field in the BSS Transition Management Request frame, BSS Transition Management Query frame, and BSS Transition Management Response frame. The Preference field value is a number ranging from 0 to 255, as defined in Table 8-116, indicating an ordering of preferences for the BSS transition candidates for this STA. Additional details describing use of the Preference field are provided in 10.23.6.

<table>
<thead>
<tr>
<th>Preference field value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Excluded BSS; reserved when present in the BSS Transition Management Query or BSS Transition Management Response frames.</td>
</tr>
<tr>
<td>1–255</td>
<td>Relative values used to indicate the preferred ordering of BSSs, with 255 indicating the most preferred candidate and 1 indicating the least preferred candidate.</td>
</tr>
</tbody>
</table>

The BSS Termination TSF field contained in the BSS Termination Duration subelement is the TSF time of the BSS transmitting the neighbor report that corresponds to the time when termination of the neighbor BSS occurs. How the BSS determines the neighbor BSS termination time is out of scope of the standard. The format of the BSS Termination Duration subelement field is shown in Figure 8-220.
The value of the Length field in the BSS Termination Duration Information subelement is 10.

The BSS Termination TSF field indicates the value of the TSF counter when BSS termination will occur in the future. A BSS Termination TSF field value of 0 indicates that termination of the BSS will occur imminently. Prior to termination of the BSS, all associated STAs are disassociated by the AP.

The Duration field is an unsigned 2-octet integer that indicates the number of minutes for which the BSS is not present. The Duration field value of 0 is reserved. The Duration field value is 65 535 when the BSS is terminated for a period longer than or equal to 65 535 minutes.

The format of the Bearing subelement field is shown in Figure 8-221.

The value of the Bearing Information subelement length field is 4.

The Bearing field specifies the direction that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned, relative to the reporting BSS and defined in relation to true north, increasing clockwise, measured in degrees from 0 degree to 359 degrees. If the Bearing value is unknown, the subelement is not included.

The Distance field specifies the distance that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned relative to the reporting BSS as a 4-octet single precision floating point value represented by a binary32 floating point value as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field, in meters. If the Distance field value is unknown the field is set to 0.

The Relative Height field, defined by a 2-octet signed integer, specifies the relative height in meters that the neighbor is positioned, relative to the reporting BSS. If the Relative height is unknown or at the same height as the reporting BSS, the field is 0.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

**8.4.2.40 RCPI element**

The RCPI element indicates the received frame power level at the receiving STA as shown in Figure 8-222.
The Element ID field is equal to the RCPI value in Table 8-54.

The Length field in octets is set to 1.

The RCPI field contains an RCPI value as specified for certain PHYs in Clause 16, Clause 18, Clause 17, Clause 19, and Clause 20.

**8.4.2.41 BSS Average Access Delay element**

The BSS Average Access Delay element contains the AP Average Access Delay, which is a measure of load in the BSS and is available in both QoS APs and non-QoS APs. The format of the BSS Average Access Delay element is defined in Figure 8-223.

The Element ID field is equal to the BSS Average Access Delay value in Table 8-54.

The Length field in octets is set to 1.

The AP Average Access Delay is a scalar indication of the relative level of loading at an AP. A low value indicates more available capacity than a higher value. If the AP is not currently transmitting any DCF or EDCAF traffic, the AP Average Access Delay is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for DCF or EDCAF transmitted frames measured from the time the DCF or EDCAF MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. Non-QoS APs average the access delays for all DCF transmitted frames. QoS APs average the access delays for all EDCA transmitted frames of all ACs. The AP Average Access Delay values are scaled as follows:

### AP Average Access Delay

<table>
<thead>
<tr>
<th>AP Average Access Delay</th>
<th>Octets: 1 1 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0: Access Delay &lt; 8 µs</td>
<td>1</td>
</tr>
<tr>
<td>1: 8 µs ≤ Access Delay &lt; 16 µs</td>
<td>1</td>
</tr>
<tr>
<td>2 ≤ n ≤ 14: n × 8 µs ≤ Access Delay &lt; (n + 1) × 8 µs</td>
<td>1</td>
</tr>
<tr>
<td>15: 120 µs ≤ Access Delay &lt; 128 µs</td>
<td>1</td>
</tr>
<tr>
<td>16: 128 µs ≤ Access Delay &lt; 144 µs</td>
<td>1</td>
</tr>
<tr>
<td>17 ≤ n ≤ 106: (n × 16) – 128 µs ≤ Access Delay &lt; ((n + 1) × 16) – 128 µs</td>
<td>1</td>
</tr>
<tr>
<td>107: 1584 µs ≤ Access Delay &lt; 1600 µs</td>
<td>1</td>
</tr>
<tr>
<td>108: 1600 µs ≤ Access Delay &lt; 1632 µs</td>
<td>1</td>
</tr>
<tr>
<td>109 ≤ n ≤ 246: (n × 32) – 1856 µs ≤ Access Delay &lt; ((n + 1) × 32) – 1856 µs</td>
<td>1</td>
</tr>
</tbody>
</table>
The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that DCF or EDCAF services are currently unable to access the channel due to continuous carrier sense mechanism deferral and that no frames were transmitted during the measurement window. The AP measures and averages the medium access delay for all transmit frames using the DCF or EDCAF over a continuous 30 s measurement window. See 10.11.16 for accuracy requirements.

8.4.2.42 Antenna element

The Antenna element contains the Antenna ID field as shown in Figure 8-224.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Antenna ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-224—Antenna element format**

The Element ID field is equal to the Antenna value in Table 8-54.

The Length field in octets is set to 1.

The Antenna ID field contains the identifying number for the relevant antenna(s). When included in a Beacon, Probe Response, or Location Track Notification frame, the Antenna ID identifies the antenna(s) used to transmit the Beacon, Probe Response, or Location Track Notification frame. When included in a measurement report, or Location Track Notification frame, the Antenna ID identifies the antenna(s) used for the reported measurement or transmission of the Location Track Notification frame. The valid range for the Antenna ID is 1 to 254. The value 0 indicates that the antenna identifier is unknown. The value 255 indicates that this measurement was made with multiple antennas, i.e., antennas were switched during the measurement duration. In a Beacon Report or Frame Report, the Antenna ID always identifies the antenna used to receive the reported beacon or frame. If during frame reception, different antennas are used to receive the preamble and body, the antenna ID identifies the antenna that receives the frame body. In these cases, the value 255 is not used. The value 1 is the only value used for a STA with only one antenna. STAs with more than one antenna assign Antenna IDs to each antenna and each antenna configuration as consecutive, positive integers starting with 1. Each Antenna ID number represents a unique antenna or unique configuration of multiple antennas characterized by a fixed relative position, a fixed relative direction, and a fixed peak gain for that position and direction.
8.4.2.43 RSNI element

The RSNI element contains an RSNI value, as shown in Figure 8-225.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>RSNI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-225—RSNI element format

The Element ID field is equal to the RSNI value in Table 8-54.

The Length field in octets is set to 1.

RSNI is in steps of 0.5 dB. RSNI is calculated by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) using the expression:

\[
RSNI = (10 \times \log_{10}(\frac{\text{RCPI}_{\text{power}} - \text{ANPI}_{\text{power}}}{\text{ANPI}_{\text{power}}}) + 10) \times 2
\]

where \(\text{RCPI}_{\text{power}}\) and \(\text{ANPI}_{\text{power}}\) indicate power domain values for RCPI and ANPI and not dB domain values. RSNI in dB is scaled in steps of 0.5 dB to obtain 8-bit RSNI values, which cover the range from –10 dB to +117 dB. The value 255 indicates that RSNI is not available. See 10.11.9.4 for details and procedures for measuring ANPI.

8.4.2.44 Measurement Pilot Transmission element

The Measurement Pilot Transmission element contains a Measurement Pilot Transmission field as shown in Figure 8-226.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Measurement Pilot Transmission</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-226—Measurement Pilot Transmission element format

The Element ID field is equal to the Measurement Pilot Transmission value in Table 8-54.

The Length field in octets is variable and depends on the number and length of optional subelements.

The Measurement Pilot Transmission field contains the Measurement Pilot Interval as specified in 8.4.1.18.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-117. A Yes in the Extensible column of a subelement listed in Table 8-117 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.4.2.45 BSS Available Admission Capacity element

The BSS Available Admission Capacity element contains a list of Available Admission Capacity fields at different User Priorities and Access Categories as shown in Figure 8-227.

**NOTE**—The BSS Available Admission Capacity element is helpful for roaming QoS STAs to select a QoS AP that is likely to accept future admission control requests, but it does not provide an assurance that the HC will admit these requests.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–220</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>1 to 255</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-227—BSS Available Admission Capacity element format**

The Element ID field is equal to the BSS Available Admission Capacity value in Table 8-54.

The Length field has units of octets and is set to \(2 + 2N_{nz}\), where \(N_{nz}\) equals the total number of nonzero bits in Available Admission Capacity Bitmask.

The Available Admission Capacity Bitmask field indicates the UP values that have an Available Admission Capacity specified in the Available Admission Capacity List field. The format of the Available Admission Capacity Bitmask is defined in Table 8-118.

### Table 8-118—Optional subelement IDs for Measurement Pilot Transmission

<table>
<thead>
<tr>

<tr>
<td>3</td>
<td>UP 3</td>
</tr>
<tr>
<td>4</td>
<td>UP 4</td>
</tr>
<tr>
<td>5</td>
<td>UP 5</td>
</tr>
</tbody>
</table>
Each bit in the Available Admission Capacity Bitmask is set to 1 to indicate that the Available Admission Capacity for the corresponding traffic type is present in the Available Admission Capacity List field. The bit is set to 0 to indicate that the Available Admission Capacity for the corresponding traffic type is not present in the Available Admission Capacity List field.

The Available Admission Capacity List comprises a sequence of Available Admission Capacity fields corresponding respectively to the nonzero bits in the Available Admission Capacity Bitmask field.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the amount of medium time available using explicit admission control for the corresponding UP or AC traffic, in units of 32 µs per 1 s. See 10.11.17 for further details.

### 8.4.2.46 BSS AC Access Delay element

The BSS AC Access Delay element contains an Access Category Access Delay field, as shown in Figure 8-228.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Access Category Access Delay</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>

<td>AC 2</td>
</tr>
<tr>
<td>11</td>
<td>AC 3</td>
</tr>
<tr>
<td>12–15</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

---

The Element ID field is equal to the BSS AC Access Delay value in Table 8-54.

The Length field in octets is set to 4.

The AC Access Delay field is formatted as four subfields as shown in Figure 8-229. The AC Access Delay is a scalar indication of the average access delay at a QoS AP for services for each of the indicated Access Categories. If the QoS AP is not currently transmitting any traffic using the indicated AC, the Average Access Delay for that AC is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for transmitted frames in the indicated AC measured from the time the EDCA MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. The AC Access Delay values are scaled as follows:
The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that EDCA services are currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 10.11.16 for accuracy requirements.

<table>

</tr>
<tr>
<td>253</td>
<td>24 576 µs ≤ Access Delay</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>254</td>
<td>Service unable to access channel</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>255</td>
<td>Measurement not available</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that EDCA services are currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 10.11.16 for accuracy requirements.

Figure 8-229—Access Category Access Delay subfields
8.4.2.47 RM Enabled Capabilities element

The RM Enabled Capabilities element signals support for radio measurements in a device. The element is shown in Figure 8-230.

<table>

</tbody>
</table>

NOTE—At a QoS AP dot11RMBSSAverageAccessDelayActivated is true indicates that the AP BSS AC Access Delay capability is also enabled.

8.4.2.48 Multiple BSSID element

The format of the Multiple BSSID element is shown in Figure 8-231.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>1</th>
<th>1</th>
<th>1</th>
<th>variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element ID</td>
<td>Length</td>
<td>MaxBSSID Indicator</td>
<td>Optional Subelements</td>
<td></td>
</tr>
</tbody>
</table>

The Element ID field is equal to the Multiple BSSID value in Table 8-54.

The value of the Length field is 1 plus the length of the extensions in units of octets.

The Max BSSID Indicator field contains a value assigned to $n$, where $2^n$ is the maximum number of BSSIDs in the multiple BSSID set, including the reference BSSID (see 10.11.14). The actual number of BSSIDs in the multiple BSSID set is not explicitly signalled. The BSSID(i) value corresponding to the $i^{th}$ BSSID in the multiple BSSID set is derived from a reference BSSID (REF_BSSID) as follows:

$$BSSID(i) = BSSID_A | BSSID_B$$

where

- $BSSID_A$ is a BSSID with $(48-n)$ MSBs equal to the $(48-n)$ MSBs of the REF_BSSID and $n$ LSBs equal to 0
- $BSSID_B$ is a BSSID with $(48-n)$ MSBs equal to 0 and $n$ LSBs equal to $[(n$ LSBs of REF_BSSID $)+i]$ mod $2^n$
  - $|$ indicates the OR operation
When the Multiple BSSID element is transmitted in a Beacon or Probe Response frame, the reference BSSID is the BSSID of the frame. More than one Multiple BSSID element may be included in a Beacon frame. The AP determines the number of Multiple BSSID elements. The AP does not fragment a nontransmitted BSSID profile subelement for a single BSSID across two Multiple BSSID elements unless the length of the nontransmitted BSSID profile subelement exceeds 255 octets. When the Multiple BSSID element is transmitted as a subelement in a Neighbor Report element, the reference BSSID is the BSSID field in the Neighbor Report element.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-120. A Yes in the Extensible column of a subelement listed in Table 8-120 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

</tbody>
</table>

The Nontransmitted BSSID Profile subelement contains a list of elements for one or more APs that have nontransmitted BSSIDs, and is defined as follows:

- For each nontransmitted BSSID, the Nontransmitted BSSID Capability element (see 8.4.2.74) is the first element included, followed by a variable number of elements, in the order defined in 8-20.
- The SSID and multiple BSSID-index subelements are included in the Nontransmitted BSSID Profile subelement.
- The FMS Descriptor element is included in the Nontransmitted BSSID Profile subelement if the Multiple BSSID element is included in a Beacon frame and if the TIM field indicates there are buffered group addressed frames for this nontransmitted BSSID.
- The Timestamp and Beacon Interval fields, DSSS Parameter Set, FH Parameter Set, IBSS Parameter Set, Country, FH Parameters, FH Pattern Table, Channel Switch Assignment, Extended Channel Switch Announcement, Supported Operating Classes, IBSS DFS, ERP Information, HT Capabilities and HT Operation elements are not included in the Nontransmitted BSSID Profile field; the values of these elements for each nontransmitted BSSID are always the same as the corresponding transmitted BSSID element values.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

The Multiple BSSID element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of the Multiple BSSID element is described 10.11.14. Nontransmitted BSSID Advertisement procedures are described in 10.1.3.6.
8.4.2.49 Mobility Domain element (MDE)

The MDE contains the Mobility Domain Identifier (MDID) and the FT Capability and Policy field. The AP uses the MDE to advertise that it is included in the group of APs that constitute a mobility domain, to advertise its support for FT capability, and to advertise its FT policy information. The format for this element is given in Figure 8-232.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>MDID</th>
<th>FT Capability and Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

Figure 8-232—MDE format

The Length field is set to 3.

The MDID field is a 2-octet value that follows the ordering conventions defined in 8.2.2.

The FT Capability and Policy field is 1 octet. The FT Capability and Policy field is defined in Figure 8-233.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1</th>
<th>B2</th>
<th>B7</th>

<tbody>
<tr>
<td>Fast BSS Transition over DS</td>
<td>Resource Request Protocol Capability</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

Bits: 1 1 6

Figure 8-233—FT Capability and Policy field

Bits 0–1 of the FT Capability and Policy field control the behavior of STAs performing fast BSS transitions (see 12.3). The STA might use information from the MDE to determine the transition methods recommended by the AP and protocols supported by the AP. The choice of executing any specific transition method is outside the scope of this standard.

If Resource Request Protocol Capability subfield is 1, then the STA may perform the FT Resource Request Protocol of 12.6.

When sent by a STA to a target AP, the FT Capability and Policy field matches the value advertised by that target AP. See 12.8.

8.4.2.50 Fast BSS Transition element (FTE)

The FTE includes information needed to perform the FT authentication sequence during a fast BSS transition in an RSN. This element is shown in Figure 8-234.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
```

Figure 8-235—MIC Control field

The Element Count subfield of the MIC Control field contains the number of elements that are included in the message integrity code (MIC) calculation. A value of 0 indicates no MIC is present.

The MIC field contains a MIC that is calculated using the algorithm specified in 12.8.4 and 12.8.5.

The ANonce field contains a value chosen by the R1KH. It is encoded following the conventions in 8.2.2.

The SNonce field contains a value chosen by the S1KH. It is encoded following the conventions in 8.2.2.

The format of the Optional Parameter(s) field is shown in Figure 8-236.

```
<table>
<thead>
<tr>
<th>Subelement ID</th>

<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

Table 8-121—Subelement IDs

R1KH-ID indicates the identity of the R1KH, which is used by the S0KH and the R0KH for deriving the PMK-R1s. It is encoded following the conventions in 8.2.2.
The GTK subelement contains the group temporal key, which is encrypted (see procedures in 12.8.5) and is defined in Figure 8-237.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Key Info</th>

</tr>
</thead>
<tbody>
<tr>
<td>Key ID</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-238—GTK subelement’s Key Info subfield**

Key Length field is the length of the Key field in octets, not including any padding (see 12.8.5).

RSC field contains the receive sequence counter (RSC) for the GTK being installed. Delivery of the RSC field value allows a STA to identify replayed MPDUs. If the RSC field value is less than 8 octets in length, the remaining octets are set to 0. The least significant octet of the transmit sequence counter (TSC) or packet number (PN) is in the first octet of the RSC field. See Table 11-5.

For WEP, the RSC value is set to 0 on transmit and is not used at the receiver.

The Wrapped Key field contains the encrypted GTK as described in 12.8.5.

When sent by a non-AP STA, the R0KH-ID indicates the R0KH with which the S0KH negotiated the PMK-R0 it is using for this transition. When sent by an AP, the R0KH-ID indicates the R0KH that the S0KH will be using to generate a PMK-R0 security association. It is encoded following the conventions from 8.2.2.

The IGTK field contains the Integrity GTK, used for protecting robust management frames. The IGTK subelement format is shown in Figure 8-239.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>KeyID</th>
<th>IPN</th>
<th>Key Length</th>
<th>Wrapped Key</th>
</tr>
</thead>
<tbody>

<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-239—IGTK subelement format**

The KeyID field indicates the value of the BIP key ID.

The IPN field indicates the receive sequence counter for the IGTK being installed. The PN field gives the current message number for the IGTK, to allow a STA to identify replayed MPDUs.

The Key Length field is the length of IGTK in octets, not including any padding (see 12.8.5).

The Wrapped Key field contains the wrapped IGTK being distributed. The length of the resulting AES-Key-wrapped IGTK in the Wrapped Key field is Key Length + 8 octets.
**8.4.2.51 Timeout Interval element (TIE)**

The TIE specifies time intervals and timeouts. Figure 8-240 shows this element.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Timeout Interval Type</th>
<th>Timeout Interval Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>

Figure 8-240—TIE format

The Length field is set to 5.

The Timeout Interval Type field contains one of the values from Table 8-122.

<table>
<thead>
<tr>
<th>Timeout Interval Type</th>
<th>Meaning</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Reassociation deadline interval</td>
<td>Time units (TUs)</td>
</tr>
<tr>
<td>2</td>
<td>Key lifetime interval</td>
<td>Seconds</td>
</tr>
<tr>
<td>3</td>
<td>Association Comeback time</td>
<td>Time units (TUs)</td>
</tr>
<tr>
<td>4–255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

Table 8-122—Timeout Interval Type field value

The Timeout Interval Value field contains an unsigned 32-bit integer. It is encoded according to the conventions in 8.2.2.

A reassocation deadline interval value of 0 indicates no deadline exists. A key lifetime interval value of 0 is reserved.

**8.4.2.52 RIC Data element (RDE)**

The RIC refers to a collection of elements that are used to express a resource request and to convey responses to the corresponding requests.

A RIC is a sequence of one or more Resource Requests, or a sequence of one or more Resource Responses. Each Resource Request or Response consists of an RDE, followed by one or more elements that describe that resource. See 12.11 for examples and procedures.

The RDE format is shown in Figure 8-241.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>RDE Identifier</th>
<th>Resource Descriptor Count</th>
<th>Status Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

Figure 8-241—RDE format

The Length field is set to 4.
The RDE Identifier field has an arbitrary 8-bit value, chosen by the resource requestor to uniquely identify the RDE within the RIC.

The Resource Descriptor Count field indicates the number of alternative Resource Descriptors that follow this RDE.

The Status Code field is used in Resource Responses to indicate the result of the request. Valid values for the Status Code field are given in 8.4.1.9. When an RDE is included in a Resource Request, the Status Code field is reserved.

### 8.4.2.53 RIC Descriptor element

The RIC Descriptor element is used with an RDE during a fast BSS transition to negotiate resources that are not otherwise described by elements. See 12.11 for procedures for including this element in a RIC.

Figure 8-242 shows the format of this element.

![Figure 8-242—RIC Descriptor element format](image)

The Length field is set to the number of octets in this element (variable).

The Resource Type field contains one of the values given in Table 8-123.

<table>
<thead>
<tr>
<th>Resource type value</th>
<th>Meaning</th>
<th>Variable parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Block Ack</td>
<td>Block Ack parameter set as defined in 8.4.1.14, Block Ack timeout value as defined in 8.4.1.15, and Block Ack starting sequence control as defined in 8.3.1.8.</td>
</tr>
<tr>
<td>0, 2–255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

Variable parameters contain any additional data based on the resource type.

### 8.4.2.54 DSE Registered Location element

A DSE Registered Location element includes DSE location configuration information (LCI), which contains latitude, longitude, and altitude information. The DSE Registered Location element format is shown in Figure 8-243.

![Figure 8-243—DSE Registered Location element format](image)
The Length field is set to 20.

The structure and information fields are little endian, per conventions defined in 8.2.2, and are based on the LCI format described in IETF RFC 3825.

The DSE Registered Location element body fields are shown in Figure 8-244.

```
+----------------+----------------+----------------+
| B0             | B5 B6          | B30            |
|Latitude Resolution| Latitude Fraction|                |

|Dependent Enablement Identifier|
| Bits           | 16             |                |
+----------------+----------------+----------------+
| B144 B151 B152 | B159           |
|Operating Class | Channel Number |
| Bits           | 8              | 8              |
```

**Figure 8-244—DSE registered location element body fields format**

The definition of fields within the DSE Registered Location element body is as defined in Section 2.1 of IETF RFC 3825 (July 2004) except as defined in this standard.

With an Altitude Type field value of 3 (i.e., height above ground is in meters), the altitude is defined to be in meters and is formatted in two's-complement, fixed-point, 22-bit integer part with 8-bit fraction.

The Datum field is a 3-bit field, rather than the 8-bit field defined in IETF RFC 3825, and the codes used are as defined in IETF RFC 3825.

The RegLoc Agreement bit field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 10.12.3); otherwise, it is 0.

The RegLoc DSE bit field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA bit field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.
The Dependent Enablement Identifier field is a 16-bit field with a value set by the enabling STA via the DSE Enablement frame; otherwise, it is set to 0.

The Operating Class field indicates the channel set for which the enablement request, report, or announcement applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the report applies. Valid values for the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the enablement request, report, or announcement applies. The channel number is defined within an operating class as shown in Annex E.

NOTE—An example of fixed/fractional notation, using the longitude of the Sears Tower from p. 13 of IETF RFC 3825 (July 2004) is shown below:

Longitude 87.63602 degrees West (or –87.63602 degrees),

Using twos-complement, 34-bit fixed point, 25-bit fraction,

Longitude = 0xf50ba5b97,
Longitude = 110101000010111011100101111 (big endian)

DSE registered location expression for a Longitude resolution of 34 bits:

Bits 40–45 Longitude resolution = (bit 40) 0 1 0 0 0 1 (bit 45)

Bits 46–70 Longitude fraction = (bit 46) 1 1 1 0 1 0 0 1 1 0 1 1 0 1 0 0 1 0 1 1 1 0 1 0 (bit 70)

Bits 71–79 Longitude integer = (bit 71) 0 0 0 1 0 1 0 1 1 (bit 79)

The octets in transmission order = E2 E5 96 2E D4.

8.4.2.55 Extended Channel Switch Announcement element

The Extended Channel Switch Announcement element is used by an AP in an infrastructure BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise when the BSS is changing to a new channel or a new channel in a new operating class. The announcement includes both the operating class and the channel number of the new channel. The element is present only when an extended channel switch is pending. The format of the Extended Channel Switch Announcement element is shown in Figure 8-245.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Channel Switch Mode</th>
<th>New Operating Class</th>
<th>New Channel Number</th>
<th>Channel Switch Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-245—Extended Channel Switch Announcement element format

The Length field is set to 4.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP in an infrastructure BSS or a STA in an IBSS sets the Channel Switch Mode field to either 0 or 1 on transmission as specified in 10.9.8.2 and 10.9.8.3. The Channel Switch Mode field is reserved in an MBSS.

The New Operating Class field is set to the number of the operating class after the channel switch, as defined in Annex E.
The New Channel Number field is set to the number of the channel after the channel switch. The channel number is a channel from the STA’s new operating class as defined in Annex E.

For nonmesh STAs, the Channel Switch Count field indicates either the number of target beacon transmission times (TBTTs) until the STA sending the Extended Channel Switch Announcement element switches to the new channel or a value of 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs anytime after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2TU when the MSB (bit 7) is 0, or in units of 100TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10TU channel switch time is encoded as X'05'.

8.4.2.56 Supported Operating Classes element

The Supported Operating Classes element is used by a STA to advertise the operating classes that it is capable of operating with in this country. The format of the Supported Operating Classes element is shown in Figure 8-246.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Current Operating Class</th>
<th>Operating Classes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>Length–1</td>
</tr>
</tbody>
</table>

Figure 8-246—Supported Operating Classes element format

The value of the Length field of the Supported Operating Classes element is between 2 and 253. The Current Operating Class octet indicates the operating class in use for transmission and reception. The Operating Classes field lists in ascending order all operating classes that the STA is capable of operating with in this country. The use of this element is described in 10.10.1 and 10.11.9.1.

8.4.2.57 Management MIC element

The Management MIC element (MME) provides message integrity and protects group addressed robust management frames from forgery and replay. Figure 8-247 shows the MME format.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>KeyID</th>
<th>IPN</th>
<th>MIC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>2</td>
<td>6</td>
<td>8</td>
</tr>
</tbody>
</table>

Figure 8-247—Management MIC element format

The value of the Element ID field is 76 decimal (4c hex).

The Length field is set to 16.

The Key ID field identifies the IGTK used to compute the MIC. Bits 0–11 define a value in the range 0–4095. Bits 12–15 are reserved. The IGTK Key ID is either 4 or 5. The remaining Key IDs are reserved.

The IPN field contains a 6 octet value, interpreted as a 48-bit unsigned integer and used to detect replay of protected group addressed robust management frames.
The MIC field contains a message integrity code calculated over the robust management frame as specified in 11.4.4.5 and 11.4.4.6.

8.4.2.58 HT Capabilities element

8.4.2.58.1 HT Capabilities element structure

An HT STA declares that it is an HT STA by transmitting the HT Capabilities element.

The HT Capabilities element contains a number of fields that are used to advertise optional HT capabilities of an HT STA. The HT Capabilities element is present in Beacon, Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, Probe Response, Mesh Peering Open, and Mesh Peering Close frames. The HT Capabilities element is defined in Figure 8-248.

<table>

**Figure 8-249—HT Capabilities Info field**
The subfields of the HT Capabilities Info field are defined in Table 8-124.

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Definition</th>
<th>Encoding</th>
</tr>
</thead>
</table>
| LDPC Coding Capability            | Indicates support for receiving LDPC coded packets | Set to 0 if not supported  
Set to 1 if supported               |
| Supported Channel Width Set       | Indicates the channel widths supported by the STA. See 10.15. | Set to 0 if only 20 MHz operation is supported  
Set to 1 if both 20 MHz and 40 MHz operation is supported  
This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of 13 or 14 in the behavior limits as specified in Annex E. |
| SM Power Save                     | Indicates the spatial multiplexing power save mode. See 10.2.4. | Set to 0 for static SM power save mode  
Set to 1 for dynamic SM power save mode  
Set to 3 for SM Power Save disabled  
The value 2 is reserved |
| HT-Greenfield                     | Indicates support for the reception of PPDUs with HT-greenfield format. See 20.1.4. | Set to 0 if not supported  
Set to 1 if supported               |
| Short GI for 20 MHz               | Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 | Set to 0 if not supported  
Set to 1 if supported               |
| Short GI for 40 MHz               | Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40 | Set to 0 if not supported  
Set to 1 if supported               |
| Tx STBC                           | Indicates support for the transmission of PPDUs using STBC | Set to 0 if not supported  
Set to 1 if supported               |
| Rx STBC                           | Indicates support for the reception of PPDUs using STBC | Set to 0 for no support  
Set to 1 for support of one spatial stream  
Set to 2 for support of one and two spatial streams  
Set to 3 for support of one, two and three spatial streams |
| HT-Delayed Block Ack              | Indicates support for HT-delayed Block Ack operation. See 9.21.8. | Set to 0 if not supported  
Set to 1 if supported               |
| Maximum A-MSDU Length             | Indicates maximum A-MSDU length. See 9.11. | Set to 0 for 3839 octets  
Set to 1 for 7935 octets             |
The following subfields are reserved for a mesh STA: Tx STBC, Rx STBC, PSMP Support.

### 8.4.2.58.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the HT Capabilities element is shown in Figure 8-250.

</tr>
</tbody>
</table>

#### 8.4.2.58.4 Supported MCS Set field

The Supported MCS Set field of the HT Capabilities element indicates which MCSs a STA supports.

An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 76. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the HT PHY, see 20.6.

The structure of the MCS Set field is defined in Figure 8-251.

![Figure 8-251—Supported MCS Set field](image-url)

The Rx MCS Bitmask subfield of the Supported MCS Set field defines a set of MCS index values, where bit B0 corresponds to MCS 0 and bit B76 corresponds to MCS 76.

**NOTE**—An HT STA includes the mandatory MCS values defined in 20.1 in the Rx MCS Bitmask subfield.

The Rx Highest Supported Data Rate subfield of the Supported MCS Set field defines the highest data rate that the STA is able to receive, in units of 1 Mb/s, where 1 represents 1 Mb/s, and incrementing by 1 Mb/s steps to the value 1023, which represents 1023 Mb/s. If the maximum data rate expressed in Mb/s is not an integer, then the value is rounded up to the next integer. The value 0 indicates that this subfield does not
specify the highest data rate that the STA is able to receive; see 9.7.6.5.3.

The Tx MCS Set Defined, Tx Rx MCS Set Not Equal, Tx Maximum Number Spatial Streams Supported, and Tx Unequal Modulation Supported subfields of the Supported MCS Set field indicate the transmit-supported MCS set, as defined in Table 8-126.

Table 8-126—Transmit MCS Set

Set to 2 for immediate feedback  
Set to 3 for delayed and immediate feedback |
| Explicit Noncompressed Beamforming Feedback Capable | Indicates whether this receiver can return noncompressed beamforming feedback matrix explicit feedback.                                      | Set to 0 if not supported  
Set to 1 for delayed feedback  
Set to 2 for immediate feedback  
Set to 3 for delayed and immediate feedback |
| Explicit Compressed Beamforming Feedback Capable | Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.                                        | Set to 0 if not supported  
Set to 1 for delayed feedback  
Set to 2 for immediate feedback  
Set to 3 for delayed and immediate feedback |
| Minimal Grouping                               | Indicates the minimal grouping used for explicit feedback reports                                                                           | Set to 0 if the STA supports groups of 1 (no grouping)  
Set to 1 indicates groups of 1, 2  
Set to 2 indicates groups of 1, 4  
Set to 3 indicates groups of 1, 2, 4 |
| CSI Number of Beamformer Antennas Supported    | Indicates the maximum number of beamformer antennas the beamformee can support when CSI feedback is required                                | Set to 0 for single Tx antenna sounding  
Set to 1 for 2 Tx antenna sounding  
Set to 2 for 3 Tx antenna sounding  
Set to 3 for 4 Tx antenna sounding |
| Noncompressed Steering Number of Beamformer Antennas Supported | Indicates the maximum number of beamformer antennas the beamformee can support when noncompressed beamforming feedback matrix is required | Set to 0 for single Tx antenna sounding  
Set to 1 for 2 Tx antenna sounding  
Set to 2 for 3 Tx antenna sounding  
Set to 3 for 4 Tx antenna sounding |
### 8.4.2.58.7 ASEL Capability field

The structure of the ASEL Capability field of the HT Capabilities element is defined in Figure 8-254.

**Table 8-128—Subfields of the Transmit Beamforming Capabilities field (continued)**

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Definition</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressed Steering Number of Beamformer Antennas Supported</td>
<td>Indicates the maximum number of beamformer antennas the beamformee can support when compressed beamforming feedback matrix is required</td>
<td>Set to 0 for single Tx antenna sounding&lt;br&gt;Set to 1 for 2 Tx antenna sounding&lt;br&gt;Set to 2 for 3 Tx antenna sounding&lt;br&gt;Set to 3 for 4 Tx antenna sounding</td>
</tr>
<tr>
<td>CSI Max Number of Rows Beamformer Supported</td>
<td>Indicates the maximum number of rows of CSI explicit feedback from the beamformee or calibration responder or transmit ASEL responder that a beamformer or calibration initiator or transmit ASEL initiator can support when CSI feedback is required.</td>
<td>Set to 0 for a single row of CSI&lt;br&gt;Set to 1 for 2 rows of CSI&lt;br&gt;Set to 2 for 3 rows of CSI&lt;br&gt;Set to 3 for 4 rows of CSI</td>
</tr>
<tr>
<td>Channel Estimation Capability</td>
<td>Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the HT Long Training fields (HT-LTFs) in a staggered sounding PPDU. See NOTE.</td>
<td>Set 0 for 1 space-time stream&lt;br&gt;Set 1 for 2 space-time streams&lt;br&gt;Set 2 for 3 space-time streams&lt;br&gt;Set 3 for 4 space-time streams</td>
</tr>
</tbody>
</table>

NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capabilities Info field. Both fields are part of the HT Capabilities element.

![Figure 8-254—ASEL Capability field](image)
The subfields of the ASEL Capability field are defined in Table 8-129.

<td>Indicates whether this STA can transmit sounding PPDUs for ASEL training on request</td>
<td>Set to 0 if not supported Set to 1 if supported</td>
</tr>
</tbody>
</table>

**8.4.2.59 HT Operation element**

The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this element is defined in Figure 8-255.

![Figure 8-255—HT Operation element format](image-url)

The Element ID field is set to the value for HT Operation element defined in Table 8-54.
The structure of the HT Operation Information field is shown in Figure 8-256.

![Figure 8-256—HT Operation Information field](image)

The Primary Channel field, subfields of the HT Operation Information field, and the Basic MCS Set field are defined in Table 8-130. The “Reserved in IBSS?” column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an IBSS. The “Reserved in MBSS?” column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an MBSS.

<tbody>
<tr>
<td>Basic MCS Set</td>
<td>Indicates the MCS values that are supported by all HT STAs in the BSS.</td>
<td>The Basic MCS Set is a bitmap of size 128 bits. Bit 0 corresponds to MCS 0. A bit is set to 1 to indicate support for that MCS and 0 otherwise. MCS values are defined in 8.4.2.58.4.</td>
<td>N</td>
<td>N</td>
</tr>
</tbody>
</table>

NOTE 1—Any change of STA Channel Width field value does not impact the value of the HT Protection field.

NOTE 2—Examples of when this bit may be set to 1 include, but are not limited to, the following situations:
- One or more non-HT STAs are associated
- A non-HT BSS is overlapping (a non-HT BSS may be detected by the reception of a Beacon where the supported rates contain only Clause 16, Clause 18, Clause 17, or Clause 19 rates)
- A management frame (excluding a Probe Request) is received where the supported rate set includes only Clause 16, Clause 18, Clause 17, and Clause 19 rates

8.4.2.60 20/40 BSS Intolerant Channel Report element format

The Element ID field is set to the value of 20/40 BSS Intolerant Channel Report element defined in Table 8-54.

The Length field of the 20/40 BSS Intolerant Channel Report element is variable and depends on the number of channels reported in the Channel List field. The minimum value of the Length field is 1 (based on a minimum length for the Channel List field of 0 octets).

Operating Class field of the 20/40 MHz BSS Intolerant Channel Report element contains an enumerated value from Annex E, encoded as an unsigned integer, specifying the operating class in which the channel list is valid. A 20/40 BSS Intolerant Channel Report only reports channels for a single operating class. Multiple 20/40 BSS Intolerant Channel Report elements are used to report channels in more than one operating class.

The Channel List field of the 20/40 MHz BSS Intolerant Channel Report element a variable number of octets, where each octet describes a single channel number. Channel numbering shall be dependent on operating class according to Annex E.

A 20/40 BSS Intolerant Channel Report element includes only channels that are valid for the regulatory domain in which the STA transmitting the element is operating and that are consistent with the Country element transmitted by the AP of the BSS of which it is a member.
8.4.2.61 Overlapping BSS Scan Parameters element

The Overlapping BSS Scan Parameters element is used by an AP in a BSS to indicate the values to be used by BSS members when performing OBSS scan operations. The format of the Overlapping BSS Scan Parameters element is shown in Figure 8-258.

![Figure 8-258—Overlapping BSS Scan Parameters element format](image)

The Element ID field value is equal to the Overlapping BSS Scan Parameters element value in Table 8-54.

The Length field is set to 14.

The OBSS Scan Passive Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveDwell as described in 10.15.5.

The OBSS Scan Active Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveDwell as described in 10.15.5.

The BSS Channel Width Trigger Scan Interval field contains a value in seconds, encoded as an unsigned integer, that a receiving STA uses to set dot11BSSWidthTriggerScanInterval as described in 10.15.5.

The OBSS Scan Passive Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveTotalPerChannel as described in 10.15.5.

The OBSS Scan Active Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveTotalPerChannel as described in 10.15.5.

The BSS Width Channel Transition Delay Factor field contains an integer value that a receiving STA uses to set dot11BSSWidthChannelTransitionDelayFactor as described in 10.15.5.

The OBSS Scan Activity Threshold field contains a value in hundredths of percent, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActivityThreshold as described in 10.15.5.

The use of each of these parameters is described in 10.15.5.

8.4.2.62 20/40 BSS Coexistence element

The 20/40 BSS Coexistence element is used by STAs to exchange information that affects 20/40 BSS coexistence.

The 20/40 BSS Coexistence element is formatted as shown in Figure 8-259.
The Element ID field is set to the value for 20/40 BSS Coexistence element defined in Table 8-54.

The structure of the 20/40 BSS Coexistence Information field is shown in Figure 8-260.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>20/40 BSS Coexistence Information field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-259—20/40 BSS Coexistence element format**

The Information Request field is used to indicate that a transmitting STA is requesting the recipient to transmit a 20/40 BSS Coexistence Management frame with the transmitting STA as the recipient.

The Forty MHz Intolerant field is set to 1 to prohibit an AP that receives this information or reports of this information from operating a 20/40 MHz BSS. When equal to 0, it does not prohibit a receiving AP from operating a 20/40 MHz BSS. This field is used for inter-BSS communication. The definition of this field is the same as the definition of the Forty MHz Intolerant field in the HT Capabilities element (see 8.4.2.58), and its operation is described in 10.15.11.

The 20 MHz BSS Width Request field is set to 1 to prohibit a receiving AP from operating its BSS as a 20/40 MHz BSS. Otherwise, it is set to 0. This field is used for intra-BSS communication. The operation of this field is described in 10.15.12.

The OBSS Scanning Exemption Request field is set to 1 to indicate that the transmitting non-AP STA is requesting the BSS to allow the STA to be exempt from OBSS scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Request field is reserved when transmitted by an AP. The OBSS Scanning Exemption Request field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

The OBSS Scanning Exemption Grant field is set to 1 by an AP to indicate that the receiving STA is exempted from performing OBSS Scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Grant field is reserved when transmitted by a non-AP STA. The OBSS Scanning Exemption Grant field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

**8.4.2.63 Time Advertisement element**

The Time Advertisement element, shown in Figure 8-261, specifies fields describing the source of time corresponding to a time standard, an external clock (external time source), an estimate of the offset between that time standard and the TSF timer, and an estimate of the standard deviation of the error in the offset estimate. This information is used by a receiving STA to align its own estimate of the time standard based on that of another STA.
The Timing Capabilities field specifies the STA’s source and encoding of the Time Value field. The encoding of the Timing Capabilities field is specified in Table 8-131.

<table>
<thead>
<tr>
<th>Value</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No standardized external time source</td>
</tr>
<tr>
<td>1</td>
<td>Timestamp offset based on UTC [see ITU-R Recommendation TF.460-4(2002) [B48]]. The Timestamp offset value in nanoseconds is defined to be 0 at the beginning of the first nanosecond of the first day of the year 1958.</td>
</tr>
<tr>
<td>2</td>
<td>UTC time at which the TSF timer is 0.</td>
</tr>
<tr>
<td>3–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

When the value of the Timing Capabilities field is 0, only the Element ID, Length, and Timing Capabilities fields are included in the Time Advertisement element.

When the value of the Timing Capabilities is 1, the following additional fields are included in the Time Advertisement element:

- Time Value field, a two’s complement integer in nanoseconds that, when added to the Timestamp present in the same transmitted frame, gives the receiving STA an estimate of the time standard at the time the frame was transmitted. The Timestamp is derived from the TSF Timer as defined in 10.21.
- Time Error field, which is set to an unsigned integer in nanoseconds that defines the standard deviation of the error in the Time Value estimate. The value of all 1s is used to indicate that the error is unknown.

When the Timing Capabilities field is 2, the following fields are included in the Time Advertisement element:

- The Time Value field is the UTC time at which the TSF Timer is 0, given that the TSF Timer units are 1 microsecond units as defined in 10.1.3. The format, including all subfields is shown in Table 8-132. For any subfield not known in the Time Value field, the subfield value is 0.
- The Time Error field is an unsigned integer in milliseconds that defines the standard deviation of the error in the Time Value estimate.
- The Time Update Counter field is a modulo 256 counter that increments each time the AP updates the Time Value UTC at which the TSF Timer is 0.

![Figure 8-261—Time Advertisement element format](image-url)
8.4.2.64 Link Identifier element

The Link Identifier element contains information that identifies a TDLS direct link. The element information format is defined in Figure 8-262.

<table>
<thead>
<tr>
<th>Octet</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–1</td>

</tr>
</tbody>
</table>

Table 8-132—Time Value field format when Timing Capabilities is 2

Element ID Length Offset Interval Awake Window Slots Maximum Awake Window Duration Idle Count

Octets: 1 1 4 4 4 4 2

Figure 8-262—Link Identifier element format

The Element ID field is defined in Table 8-54.

The Length field is set to 18.

The BSSID field is set to the BSSID of the BSS to which the TDLS initiator STA is associated.

The TDLS initiator STA Address field is set to the TDLS initiator STA’s MAC address.

The TDLS responder STA Address field is set to the TDLS responder STA’s MAC address.

8.4.2.65 Wakeup Schedule element

The Wakeup Schedule element contains information regarding the periodic wakeup schedule for TDLS Peer Power Save Mode. The element format is defined in Figure 8-263.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Offset</th>
<th>Interval</th>
<th>Awake Window Slots</th>
<th>Maximum Awake Window Duration</th>
<th>Idle Count</th>

<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Figure 8-263—Wake up Schedule element format

The Element ID field is defined in Table 8-54.
The Length field is set to 18.

The Offset field is the time in microseconds between TSF 0 and the start of a first Awake Window. See 10.2.1.14.

The Interval field is set to the time in microseconds between the start of two successive Awake Windows. See 10.2.1.14.

The Awake Window Slots field is set to the duration of the Awake Window in units of backoff slots (see 9.19.2.3). See 10.2.1.14.

The Maximum Awake Window Duration field is set to the maximum duration of the Awake Window, in units of microseconds. See 10.2.1.14.

The Idle Count field is set to the number of consecutive Awake Windows during which no individually addressed frame is received from the TDLS peer STA before a TDLS peer STA deletes the wakeup schedule. See 10.2.1.14.

### 8.4.2.66 Channel Switch Timing element

The Channel Switch Timing element contains information regarding the channel switch timing. The element is defined in Figure 8-264.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>SwitchTime</th>
<th>Switch Timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-264—Channel Switch Timing element format**

The Element ID field is defined in Table 8-54

The Length field is set to 4.

The Switch Time field is set to the time it takes for a STA sending the Channel Switch Timing element to switch channels, in units of microseconds.

The Switch Timeout field is set to a time in units of microseconds. The STA sending the Channel Switch Timing element waits for the first data frame exchange on the off-channel for Switch Timeout microseconds before switching back to base channel. The time is measured from the end of the last symbol of the ACK frame that is transmitted in response to TDLS Channel Switch Response frame, as seen at the air interface.

### 8.4.2.67 PTI Control element

The PTI Control element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is optionally included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 8-265.
The Element ID field is defined in Table 8-54.

The Length field is set to 3.

The TID field contained in the PTI Control element is set to the TID of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 10.2.1.15.

The Sequence Control field is defined in 8.2.4.4. The Sequence Control field contained in the PTI Control element is set to the sequence number of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 10.2.1.15.

8.4.2.68 TPU Buffer Status element

The TPU Buffer Status element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 8-266.

The Element ID field is defined in Table 8-54.

The Length field is set to 1.

The AC_BK traffic available field is one bit in size and is set to 1 if AC_BK contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_BE traffic available field is one bit in size and is set to 1 if AC_BE contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_VI traffic available field is one bit in size and is set to 1 if AC_VI contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_VO traffic available field is one bit in size and is set to 1 if AC_VO contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.
8.4.2.69 Event Request element

8.4.2.69.1 Event Request definition

The Event Request element contains a request to the receiving STA to perform the specified event action. The format of the Event Request element is shown in Figure 8-267.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>Element ID</th>
<th>Length</th>
<th>Event Token</th>
<th>Event Type</th>
<th>Event Response Limit</th>
<th>Event Request</th>
</tr>
</thead>
</table>

Figure 8-267—Event Request element format

The Element ID field is equal to the Event Request value in Table 8-54.

The value of the Length field is 3 plus the length of the Event Request field.

The Event Token field is a nonzero number that is unique among the Event Request elements sent to each destination MAC address for which a corresponding Event Report element has not been received.

The Event Type field is a number that identifies the type of event request. The Event Types are shown in Table 8-133.

Table 8-133—Event Type definitions for event requests and reports

<table>
<thead>
<tr>
<th>Name</th>
<th>Event Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transition</td>
<td>0</td>

</tr>
<tr>
<td>Vendor Specific</td>
<td>221</td>
</tr>
<tr>
<td>Reserved</td>
<td>222–255</td>
</tr>
</tbody>
</table>

The Event Response Limit field contains the maximum number of requested Event Reports to be included in the Event Report element. A value of 0 indicates that no limit is set on the number of Event Reports to be included in the Event Report element.

The Event Request field contains the event request corresponding to the Event Type, as described in 8.4.2.69.2 through 8.4.2.69.4. The Event Request field is not present when requesting a WNM Log report.

The Event Request element is included in an Event Request frame, as described in 8.5.14.2. The use of the Event Request element and Event Request frame is described in 10.23.2.
8.4.2.69.2 Transition event request

The Event Request field corresponding to the Transition event request contains zero or more Transition Event Request subelements. A transition event is a STA movement or attempted movement from one BSS (the source BSS) in one ESS to another BSS (the target BSS) within the same ESS.

The Transition Event subelements specify the conditions in which a Transition Event Report is sent by a STA. The set of valid Transition Event Request subelements is defined in Table 8-134.

<table>
<thead>
<tr>
<th>Order</th>
<th>Transition Event Request subelement</th>
<th>Subelement ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Transition Target BSSID</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>Transition Source BSSID</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Transition Time Threshold</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>Transition Result</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>Frequent Transition</td>
<td>4</td>
</tr>
<tr>
<td>—</td>
<td>Reserved</td>
<td>5–255</td>
</tr>
</tbody>
</table>

Table 8-134—Transition Event Request subelement

The Transition Target BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the target BSSID is equal to the specific BSSID in the Target BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all target BSSIDs. The format of the Transition Target BSSID subelement is shown in Figure 8-268.

Figure 8-268—Transition Target BSSID subelement format

The value of the Length field is 6.

The Target BSSID field contains a 6-octet BSSID.

The Transition Source BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the source BSSID is equal to the BSSID specified in the Source BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the Transition Source BSSID subelement is shown in Figure 8-269.

Figure 8-269—Transition Source BSSID subelement format
The Subelement ID field is equal to the Transition Source BSSID value in Table 8-134.

The value of the Length field is 6.

The Source BSSID field contains a 6-octet BSSID.

The Transition Time Threshold subelement is used to request that a Transition Event Report includes the transition event entry when the Transition Time is greater than or equal to the Transition Time Threshold value. The format of the Transition Time subelement is shown in Figure 8-270.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Transition Time Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-270—Transition Time Threshold subelement format

The Subelement ID field is equal to the Transition Time Threshold value in Table 8-134.

The value of the Length field is 2.

The Transition Time Threshold field contains a value representing the Transition Time to be used as the threshold value for the Transition Time condition in TUs. The Transition Time is defined in 10.23.2.2.

The Transition Result subelement is used to request that a Transition Event Report includes the transition event entry that matches the transition result defined by this subelement. The format of Transition Result subelement is shown in Figure 8-271.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Match Value</th>

<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-271—Transition Result subelement format

The Subelement ID field is equal to the Transition Result value in Table 8-134.

The value of the Length field is 1.

The Match Value field is set with each bit as defined in Figure 8-272 to request that the specified transition results that match the bit descriptions are included in the Transition Event Report.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1</th>
<th>B2-B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include Successful Transitions</td>
<td>Include Failed Transitions</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

Bits: 1 1 6

Figure 8-272—Match Value field definitions
The Frequent Transition subelement is used to request that an alerting Transition Event report be generated when the total transition count during the specified time period is equal to or greater than the value given in the Frequent Transition Count Threshold field. The format of the Frequent Transition subelement is shown in Figure 8-273.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Frequent Transition Count Threshold</th>
<th>Time Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-273—Frequent Transition subelement format**

The Subelement ID field is equal to the Frequent Transition value in Table 8-134.

The value of the Length field is 3.

The Frequent Transition Count Threshold field is a 1-octet field containing the number of transitions in the measurement duration after which a Transition Event Report is generated.

The Time Interval field is the time interval in TUs during which the STA determines if the Frequent Transition Count Threshold is exceeded.

**8.4.2.69.3 RSNA event request**

The Event Request field corresponding to an RSNA event request contains zero or more RSNA Event Request subelements.

The RSNA Event Request subelements are defined to have a common format consisting of a 1 octet Subelement ID field, a 1 octet Length field, and a variable-length subelement specific information field. See Figure 8-402. The set of valid RSNA Event Request subelements is defined in Table 8-135.

<table>
<thead>
<tr>
<th>Order</th>
<th>RSNA Event Request subelement</th>
<th>Subelement ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RSNA Target BSSID</td>
<td>0</td>

<td>EAP Method</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>RSNA Result</td>
<td>3</td>
</tr>
<tr>
<td>—</td>
<td>Reserved</td>
<td>4–255</td>
</tr>
</tbody>
</table>

**Table 8-135—RSNA Event Request subelement**

The RSNA subelements specify reporting conditions for RSNA Event Reports.

The RSNA Target BSSID subelement identifies the BSS at which an RSNA Event establishment was attempted. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the RSNA Target BSSID subelement is shown in Figure 8-274.
The Subelement ID field is equal to the RSNA Target BSSID value in Table 8-135.

The value of the Length field is 6.

The Target BSSID field contains a 6-octet BSSID.

The Authentication Type subelement is used to request that an RSNA Event Report includes the RSNA event entry when the Authentication Type is equal to the authentication type specified in the Authentication Type field. The format of the Authentication Type subelement is shown in Figure 8-275.

The Subelement ID field is equal to the Authentication Type value in Table 8-135.

The value of the Length field is 4.

The Authentication Type field contains one of the AKM suite selectors defined in Table 8-101 in 8.4.2.27.3.

The EAP Method subelement is used to request that an RSNA Event Report includes the RSNA event entry when the EAP Method is equal to the EAP method specified in the EAP Method field. The format of the EAP Method subelement is shown in Figure 8-276.

The Subelement ID field is equal to the EAP Method value in Table 8-135.

The value of the Length field is 1 or 8.

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254, and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254, and is excluded otherwise.
The RSNA Result subelement is used to request that an RSNA Event Report includes the RSNA event entry that matches the transition result defined by this subelement. The format of RSNA Result subelement is shown in Figure 8-277.

```
<table>
<thead>

```

**Figure 8-278—Match Value field definitions**

8.4.2.69.4 Peer-to-Peer Link event request

The Event Request field corresponding to Peer-to-Peer Link event request contains zero or more Peer-to-Peer Link Event Request subelements.

The Peer-to-Peer Link Event Request subelements are defined to have a common format consisting of a 1 octet Subelement ID field, a 1 octet Length field, and a variable-length subelement specific information field. The set of valid Peer-to-Peer Link Event Request subelements is defined in Table 8-136.

<table>
<thead>
<tr>
<th>Order</th>
<th>Peer-to-Peer Link Event Request subelement</th>
<th>Subelement ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Peer Address</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>Channel Number</td>
<td>1</td>
</tr>
<tr>
<td>—</td>
<td>Reserved</td>
<td>2–255</td>
</tr>
</tbody>
</table>

**Table 8-136—Peer-to-Peer Link Event Request subelement**

The Peer-to-Peer Link subelements specify reporting conditions for Peer-to-Peer Link Event Reporting.

The Peer Address subelement identifies the peer STA, BSS, or IBSS of the Peer-to-Peer links to be reported. Excluding this subelement from the Event Request element indicates a request for Peer-to-Peer Link events for any peer STA, any BSS, and any IBSS. The format of the Peer Address subelement is shown in Figure 8-279.
The Subelement ID field is equal to the Peer Address value in Table 8-136.

The value of the Length field is 6.

The Peer STA/BSSID Address field contains a 6-octet MAC address of a peer STA or a BSSID for Peer-to-Peer links in an IBSS. If the indicated address matches the Address 1 field of the MAC Header contents (see Table 8-19), then the address is a peer STA address for a TDLS or IBSS. If the indicated address matches the Address 3 field of the MAC Header contents, then the address is a BSSID for the Direct Link in an infrastructure BSS or for the IBSS.

The Channel Number subelement identifies the channel for the Peer-to-Peer links to be reported. Excluding this subelement from the Event Request element indicates a request for Peer-to-Peer Link events for any channel. The format of the Channel Number subelement is shown in Figure 8-280.

**Figure 8-279—Peer Address subelement format**

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Peer STA/BSSID Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-280—Channel Number subelement format**

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Operating Class</th>
<th>Channel Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

The Subelement ID field is equal to the Channel Number value in Table 8-136.

The value of the Length field is 2.

The Operating Class field indicates the channel set of the Peer-to-Peer link to be used for the Peer-to-Peer Link event report. Operating Classes are defined in Annex E.

The Channel Number field indicates the channel number of the Peer-to-Peer Link events requested and included in the Peer-to-Peer Link event report. A Channel Number of 0 indicates a request to report any Peer-to-Peer Link event for any supported channel in the specified filtering Operating Class.

**8.4.2.69.5 Vendor Specific event request**

The Event Request field corresponding to Vendor Specific event request contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28).

**8.4.2.70 Event Report element**

**8.4.2.70.1 Event Report Definition**

The Event Report element is used by a STA to report an event. The format of the Event Report element is shown in Figure 8-281.
The Element ID field is equal to the Event Report value in Table 8-54.

The value of the Length field is 3 or 26 plus the length of the Event Report field.

The Event Token field is the Event Token in the corresponding Event Request element. If the Event Report element is being sent autonomously then the Event Token is 0.

The Event Type field is a number that identifies the type of event report. The Event Types are shown in Table 8-133.

The Event Report Status field is a value in Table 8-137, indicating the STA’s response to the Event Request.

The Event TSF, UTC Offset, Event Time Error, and Event Report fields are present only when the Event Report Status field is 0.

The Event TSF field is TSF value when the STA logged the event.

The UTC Offset field is the UTC value that corresponds to the UTC time when the TSF timer is equal to 0. If the UTC Offset is unknown, the field is 0.

The Event Time Error field is the UTC standard deviation, as described in 8.4.2.63, that corresponds to the TSF value logged for the event. If the Event Time Error is unknown, the field is 0.
The Event Report field contains the specification of a single event report, as described in 8.4.2.70.2 through 8.4.2.70.5.

The Event Report element is included in an Event Report frame, as described in 8.5.14.3. The use of the Event Report element and frame is described in 10.23.2.

8.4.2.70.2 Transition event report

The format of the Event Report field corresponding to a Transition event report is shown in Figure 8-282.

<table>

Figure 8-282—Event Report format for Transition event

The Source BSSID field contains the 6-octet BSSID address of the associated AP prior to the attempted transition.

The Target BSSID field contains the 6-octet BSSID address of the AP that is the target of the attempted Transition.

The Transition Time field contains the transition time in TUs. The transition time is defined in 10.23.2.2.

The Transition Reason field indicates the reason why a transition attempt occurred and contains one of the values in Table 8-138.

Table 8-138—Transition and Transition Query reasons

<table>
<thead>
<tr>
<th>Transition Reason value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>9</td>
<td>AP failed 4-Way Handshake</td>
</tr>
</tbody>
</table>
The Transition Result field contains the result of the attempted transition and is one of the status codes specified in Table 8-37 in 8.4.1.9.

The Source RCPI field indicates the received channel power of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Source RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 8.4.2.43.

The Source BSSID, Source RCPI, and Source RSNI fields are set to 0 if the transition is initiated by an Association Request frame.

The Target RCPI field indicates the received channel power of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received channel power of the most recently measured frame from the Target BSSID. The Target RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Target RSNI field indicates the received signal-to-noise indication of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received signal-to-noise indication of the most recently measured frame from the Target BSSID. The Target RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 8.4.2.43.

8.4.2.70.3 RSNA event report

The format of the Event Report field corresponding to an RSNA event report is shown in Figure 8-283.

<table>
<thead>
<tr>
<th>Target BSSID</th>
<th>Authentication Type</th>
<th>EAP Method</th>
<th>RSNA Result</th>
<th>RSNE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>6</td>
<td>4</td>
<td>1 or 8</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-283—Event Report format for RSNA event**

The Target BSSID field contains the 6-octet BSSID address of the AP accepting the authentication attempt.

The Authentication Type field contains the Authentication type in use at the time of the authentication attempt and is one of the AKM suite selectors defined in Table 8-101 in 8.4.2.27.3.

When the Authentication Type field is the value of either 00-0F-AC:1 (Authentication negotiated over IEEE 802.1X or using PMKSA caching as defined in 11.5.9.3) or 00-0F-AC:3 (AKM suite selector for Fast BSS Transition as defined in 11.5.3), the EAP Method field contains the IANA assigned EAP type. The EAP type contains either the legacy type (1 octet) or the expanded type (1 octet type = 254, 3-octet Vendor ID, 4-octet Vendor-Type). The EAP Method field is 0 otherwise. The EAP Method field is a single octet set to 0 otherwise.

The RSNA Result field contains the result of the RSNA establishment attempt and is one of the status codes specified in Table 8-37 in 8.4.1.9.

The RSNE field contains the entire contents of the negotiated RSNE at the time of the authentication attempt. The maximum length of the RSNE field is less than the maximum length of an RSNE, as defined in 8.4.2.27. If the length of the RSNE included here exceeds the maximum length of the RSNE field, the RSNE shall be truncated to the maximum length allowed for the RSNE field.

8.4.2.70.4 Peer-to-Peer Link event report

The format of the Event Report field corresponding to a Peer-to-Peer Link event report is shown in Figure 8-284.

<table>
<thead>
<tr>
<th>Peer STA/BSSID Address</th>
<th>Operating Class</th>
<th>Channel Number</th>
<th>STA Tx Power</th>
<th>Connection Time</th>
<th>Peer Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>6</td>
<td>1</td>
<td>1</td>
<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-284—Event Report format for Peer-to-Peer Link event**

A Peer-to-Peer link is defined to be either a Direct Link within a QoS BSS, a TDLS, or a STA-to-STA communication in an IBSS.

The Peer STA/BSSID Address field contains a 6-octet MAC address. If this event is for a Peer-to-Peer link in an infrastructure BSS, this field contains the MAC address of the peer STA. If this event is for a Peer-to-Peer link in an IBSS, this field contains the BSSID of the IBSS.

The Operating Class field indicates the channel set of the Peer-to-Peer link. Valid values of the Operating Class are shown in Annex E.
The Channel Number field indicates the Peer-to-Peer channel number of the Peer-to-Peer link. The Channel Number is defined within a Operating Class as shown in Annex E.

The STA Tx Power field indicates the target transmit power at the antenna in dBm with a tolerance of ± 5 dB of the lowest basic rate of the reporting STA.

The Connection Time field contains the connection time in seconds. If the Peer Status is 0, this field indicates the duration of the Direct Link. If the Peer Status is 1, this field indicates the time difference from the time the Direct Link was established to the time at which the reporting STA generated the event report. If the Peer Status is 2, this field indicates the duration of the IBSS membership. If the Peer Status is 3, this field indicates the time difference from the time the STA joined the IBSS to the time at which the reporting STA generated the event report. See 10.23.2.4.

The Peer Status field indicates the Peer link connection status as indicated in Table 8-139.

<table>

</tr>
</tbody>
</table>

8.4.2.70.5 WNM Log event report

The format of the Event Report field corresponding to a WNM Log event report is shown in Figure 8-285.

![WNM Log Msg](Figure 8-285—Event Report format for WNM Log event)

The WNM Log Msg field contains the entire syslog message, consisting of the PRI, HEADER, and MSG portion of a WNM Log message as described in IETF RFC 3164-2001. The TAG field of the MSG portion of the message is a 17 octet string containing the ASCII representation of the STA MAC address using hexadecimal notation with colons between octets. The octet containing the individual/group bit occurs last, and that bit is in the least significant position within that octet. See 10.23.2.5.

8.4.2.70.6 Vendor Specific event report

The Event Report field corresponding to Vendor Specific event report contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28).
8.4.2.71 Diagnostic Request element

8.4.2.71.1 Diagnostic Request definition

The Diagnostic Request element contains a request that the receiving STA undertake the specified diagnostic action. The format of the Diagnostic Request element is shown in Figure 8-286.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Diagnostic Token</th>
<th>Diagnostic Request Type</th>
<th>Diagnostic Timeout</th>
<th>Diagnostic Information Subelements (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-286—Diagnostic Request element format

The Element ID field is equal to the Diagnostic Request value in Table 8-54.

The value of the Length field is 4 plus the length of the Diagnostic Information Subelements field. The minimum value of the Length field is 4 (based on a minimum length for the Diagnostic Information Subelements field of 0 octets).

The Diagnostic Token field is a number that is unique among the Diagnostic Request elements sent to each destination MAC address for which a corresponding Diagnostic Report element has not been received.

The Diagnostic Request Type field is a number that identifies a type of diagnostic request. The values of Diagnostic Request Types are shown in Table 8-140.

Table 8-140—Diagnostic Request/Report Type definitions

<table>
<thead>
<tr>
<th>Name</th>

<td>221</td>
</tr>
<tr>
<td>Reserved</td>
<td>222–255</td>
</tr>
</tbody>
</table>

The Diagnostic Timeout field contains the time, in seconds, after which no response is returned.

The Diagnostic Information Subelements field contains zero or more diagnostic information subelements depending on the specific Diagnostic Request Type, as defined in 8.4.2.71.2 through 8.4.2.71.4.

The Cancel Diagnostic Request, Manufacturer Information STA Report, and Configuration Profile Diagnostic Request elements carry no Diagnostic Information subelements.
The Diagnostic Request element is included in a Diagnostic Request frame, as described in 8.5.14.4. The use of Diagnostic Request element and frames is described in 10.23.3.

8.4.2.71.2 Association Diagnostic request

The Diagnostic Information Subelements field corresponding to an Association Diagnostic request type is shown in Table 8-141. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

<table>
<thead>
<tr>

</tbody>
</table>

8.4.2.71.4 Vendor Specific diagnostic request

The Diagnostic Information Subelements field corresponding to a Diagnostic Request element of type Vendor Specific diagnostic request contains zero or more Vendor Specific subelements. The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.71.5 Diagnostic Information subelement descriptions

The following text describes the various subelements that may be included in Diagnostic Information Subelements field of a Diagnostic Request element (8.4.2.71) or a Diagnostic Report element (8.4.2.72). The format of a Diagnostic Information subelement is shown in Figure 8-287.
The Diagnostic Information Subelement ID field indicates the Diagnostic Information subelement ID and is any allocated value in Figure 8-143.

<th>AKM Suite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

**Figure 8-289—AKM Suite subelement format**

The OUI and AKM Suite fields identify the authentication method, and the AKM suite selector is one of the values in Table 8-101 in 8.4.2.27.3.

The format of the AP descriptor subelement is described in Figure 8-290.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>BSSID</th>
<th>Operating Class</th>
<th>Channel Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-290—AP Descriptor subelement format**
The **BSSID** field is a 6-octet field, as described in 8.2.4.3.4, that identifies the BSS indicated in the AP Descriptor subelement.

The **Operating Class** field contains an enumerated value from Annex E specifying the frequency band in which the Channel Number is valid.

The **Channel Number** field indicates the current operating channel of the AP identified by the BSSID in the AP Descriptor.

The format for the **Antenna Type** subelement is shown in Figure 8-291.

![Figure 8-291—Antenna Type subelement format](image)

The **Antenna Count** field contains a 1-octet field indicating the number of antennas of the indicated Antenna Type and Antenna Gain pair. The Antenna Count field value 0 is reserved.

The **Antenna Gain** field contains the peak gain, in dBi, of the antenna.

The **Antenna Type** field contains an ASCII string (truncated to 251 octets if required) describing the manufacturer’s type information (i.e., a series of letters/numbers) of the antenna(s) connected to the wireless adapter. The Antenna Type field does not change based on different modes of operation of the antenna(s), as may be identified by the Antenna ID field (see 8.4.2.42). This string is not null terminated.

**NOTE**—Beamforming antennas might have several Antenna IDs, depending on antenna bearing.

The format for the **Cipher Suite** subelement is shown in Figure 8-292.

![Figure 8-292—Cipher Suite subelement format](image)

The **OUI** and **Suite Type** fields identify the cipher suite, and the cipher suite selector is one of the values in Table 8-99.

The format for the **Collocated Radio Type** subelement is shown in Figure 8-293.

![Figure 8-293—Collocated Radio Type subelement format](image)

The Collocated Radio Type subelement contains a 1-octet field indicating the type of collocated radio, and is one of the values in Table 8-145. The method that a STA uses to obtain the information on the Collocated Radio is out of the scope of this standard.
The Device Type subelement reports the type of device in which the IEEE 802.11 STA resides. The format of the Device Type subelement is shown in Figure 8-294.

<table>

```

**Figure 8-303—Profile ID subelement format**

The Profile ID field contains a unique identifier for referencing a configuration profile available on a device. The value of the identifier is uniquely associated to a single configuration profile on the device sending the identifier.

The format for the Supported Operating Classes subelement is shown in Figure 8-304.

```
<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Supported Operating Classes Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>
```

**Figure 8-304—Supported Operating Classes subelement format**

The Supported Operating Classes Element field contains the Supported Operating Classes element, as defined in 8.4.2.56.

The format for the Status Code subelement is shown in Figure 8-305.

```
<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Status Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>
```

**Figure 8-305—Status Code subelement format**

The Status Code field contains the final IEEE 802.11 Status code, as defined in Table 8-37 in 8.4.1.9, received at the end of the applicable operation.
The format for the SSID subelement is shown in Figure 8-306.

![Figure 8-306—SSID subelement format](image)

The SSID field contains a Service Set Identifier with a maximum length of 32 octets, as defined in 8.4.2.2.

The format for the Tx Power Capability subelement is shown in Figure 8-307.

![Figure 8-307—Tx Power Capability subelement format](image)

The Tx Power Mode field identifies the transmit power mode of the non-AP STA and is one of the values in Table 8-148.

<table>
<thead>
<tr>
<th>Tx Power Mode</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discrete</td>
<td>0</td>
</tr>
<tr>
<td>Range</td>
<td>1</td>
</tr>
<tr>
<td>Reserved</td>
<td>2–255</td>
</tr>
</tbody>
</table>

The Tx Power field indicates the target transmit power level(s) at the antenna(s), where the actual power is within ±5 dB to the target. Each transmit power level is encoded in a single octet as a two's complement value in dBm, rounded to the nearest integer. If the Tx Power Mode field is 0 then the Tx Power field contains one or more transmit power levels in increasing numerical order. If the Tx Power Mode field is 1, the Tx Power field contains the STA’s minimum and nonzero maximum transmit power levels, in that order.

The format for the Certificate ID subelement is shown in Figure 8-308.

![Figure 8-308—Certificate ID subelement format](image)

The Certificate ID field contains an UTF-8 string indicating the assigned identifier for the STA. This string is not null terminated. The Certificate ID typically takes the form of “WFA3991” and might be used by a receiving STA to look up the certificate assigned to that ID using a web lookup url such as http://certifications.wi-fi.org/pdf_certificate.php?cid=WFA3991.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).
8.4.2.72 Diagnostic Report element

8.4.2.72.1 Diagnostic Report definition

The Diagnostic Report element contains a Diagnostic report. The format of the Diagnostic Report element is shown in Figure 8-309.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Diagnostic Token</th>
<th>Diagnostic Report Type</th>
<th>Diagnostic Status</th>
<th>Diagnostic Information Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-309—Diagnostic Report element format**

The Element ID field is equal to the Diagnostic Report value in Table 8-54.

The value of the Length field is 3 plus the length of the Diagnostic Information Subelements field. The minimum value of the Length field is 3.

The Diagnostic Token field is the Diagnostic Token in the corresponding Diagnostic Request element.

The Diagnostic Report Type field is a number that identifies the Diagnostic report. The Diagnostic Report Types are defined in Table 8-140.

The Diagnostic Status field is a value in Table 8-137 (see 8.4.2.70), indicating the STA’s response to the Diagnostic Request indicated by the Diagnostic Token.

The Diagnostic Information Subelements field contains the results of the diagnostic request.

The Diagnostic Information Subelements field contains the diagnostic subelement values, defined in 8.4.2.71.5 corresponding to the Diagnostic Report Type field value.

The Diagnostic Report element is included in a Diagnostic Report frame, as described in 8.5.14.5. The use of Diagnostic Report element and frames is described in 10.23.3.

8.4.2.72.2 Manufacturer Information STA Report

The contents of the Diagnostic Information Subelements field of a Diagnostic Report element of type Manufacturer Information STA Report is shown in Table 8-149. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information subelement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Manufacturer OI</td>
</tr>
<tr>

Table 8-152—IEEE 802.1X Authentication Diagnostic report contents

8.4.2.72.6 Vendor Specific diagnostic report

The contents of the Diagnostic Information subelements field of a Diagnostic Report element of type Vendor Specific contains zero or more Vendor Specific subelements that have the same formats as Vendor Specific elements in 8.4.2.28.

8.4.2.73 Location Parameters element

8.4.2.73.1 Location Parameters definition

The Location Parameters element is used for location services. The format of this element is shown in Figure 8-310.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Location Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-310—Location Parameters element format

The Element ID field is equal to the Location Parameters value in Table 8-54.

The value of the Length field is the length of the Location Subelements field.

The Location Subelements field contains one or more Location subelements described in Table 8-153.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Subelement name</th>
<th>Length (in octets)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

</tr>
<tr>
<td>3</td>
<td>Location Status (see 8.4.2.73.4)</td>
<td>4</td>
</tr>
</tbody>
</table>

Table 8-153—Location subelements
The Location Parameters element is included in Location Configuration Request frames, as described in 8.5.14.6; Location Configuration Response frames, as described in 8.5.14.7; and Location Track Notification frames, as described in 8.5.8.17. The use of the Location Parameters element is described in 10.23.4.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of Optional subelements.

8.4.2.73.2 Location Indication Parameters subelement

The Location Indication Parameters subelement contains STA location reporting characteristics. The format of the Location Indication Parameters subelement is shown in Figure 8-311.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Subelement name</th>
<th>Length (in octets)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

The Subelement ID field contains the value for Location Indication Parameters as defined in Table 8-153.

The Length field is 16.

The Indication Multicast Address field specifies the destination address to which the Location Track Notification frames are sent in a non-IBSS network. The value of this field is a locally administered group.
address formed according to the procedure defined in 10.23.4.1. The field is reserved when Location Track Notifications are transmitted in an IBSS.

The Report Interval Units field contains the units used for the Normal Report Interval field and In-Motion Report Interval field, as indicated in Table 8-154.

Table 8-154—Report Interval Units field

<table>
<thead>
<tr>
<th>Report Interval Units</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Hours</td>
</tr>
<tr>
<td>1</td>
<td>Minutes</td>
</tr>
<tr>
<td>2</td>
<td>Seconds</td>
</tr>
<tr>
<td>3</td>
<td>Milliseconds</td>
</tr>
<tr>
<td>4–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The Normal Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the reporting STA is expected to transmit one or more Location Track Notification frames if either dot11MgmtOptionMotionDetectionActivated is false or the STA is stationary. The STA does not transmit Location Track Notification frames when the Normal Report Interval is 0.

The Normal Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each Normal Report Interval.

Motion is the act or process of moving, or a particular action or movement relative to the point at which the STA is configured to send Location Track Notification frames. Motion might be detected using one of the following criteria:

- Detection of speed that is greater or equal to 0.5 m/sec.
- Detection of movement or vibration, for example by a ball-in-tube sensor or accelerometer or other means.

The exact criteria and mechanism to detect motion is out of scope for this standard.

The In-Motion Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the STA reports its location by sending a Location Track Notification frame when the reporting STA is in motion. If dot11MgmtOptionMotionDetectionActivated is false, this field is 0.

The In-Motion Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each In-Motion Report Interval. If dot11MgmtOptionMotionDetectionActivated is false, this field is 0.

The Burst Inter-frame Interval is the target time interval, expressed in milliseconds, between the transmissions of each of the Normal or In-Motion frames on the same channel. The Burst Inter-frame interval value is 0 to indicate that frames are transmitted with no target inter-frame delay.

The Tracking Duration is the amount of time, in minutes, that a STA sends the Location Track Notification frames. The duration starts as soon as the STA sends a Location Configuration Response frame with a Location Status value of Success. If the Tracking Duration value is a nonzero value the STA sends Location Track Notification Frames, based on the Normal and In-Motion Report Interval field values, until the duration ends. If the Tracking Duration is 0 the STA continuously sends Location Track Notification frames.
as defined by Normal and In-Motion Report Interval field values until transmission is terminated based on the procedures detailed in 10.23.4.2.

The ESS Detection Interval is the periodicity, in minutes, that a STA checks for beacons transmitted by one or more APs belonging to the same ESS that configured the STA. If no beacons from the ESS are received for this period, the STA terminates transmission of Location Track Notification frames, as described in the procedures detailed in 10.23.4.2. The ESS Detection Interval field is not used when the ESS Detection Interval field value is 0.

### 8.4.2.73.3 Location Indication Channels subelement

The Location Indication Channels subelement contains location reporting channel information. The format of the Location Indication Channels subelement format is shown in Figure 8-312.

![Figure 8-312—Location Indication Channels subelement](image)

The Subelement ID field contains the value for Location Indication Channels as defined in Table 8-153.

The Length field is $2^n$, where $n$ indicates the total number of Channel Entry subelements contained in the element.

The Channel Entry field includes one or more Operating Class and Channel pair. The format Channel Entry field is shown in Figure 8-313.

![Figure 8-313—Channel Entry field format](image)

The Operating Class field each indicates the frequency band on which a STA transmits Location Track Notification frames. All Operating Class field values are for the country specified in the Beacon frame. Valid values of the Operating Class field are defined in Annex E.

The Channel field includes the channel numbers on which a STA sends or an ESS expects to receive Location Track Notification frames. Valid values of the Channel field are defined in Annex E.

### 8.4.2.73.4 Location Status subelement

The Location Status subelement provides the result of a Location Request or Location Configuration Request frame. The format of the Location Status subelement is shown in Figure 8-314.
The Subelement ID field contains the value for Location Status as defined in Table 8-153.

The Length field is 2.

The Config Subelement ID field is a specific Location Parameters subelement ID transmitted in a Location Configuration Request frame as defined in Table 8-153.

A Location Status subelement is included for each configuration subelement in the Location Configuration Request frame, except when all status values are the same. When all status values are the same, one Location Status subelement is included with the Config subelement ID set to 0 in the Location Configuration Response frame.

The Status field identifies the result of the Location Request frame and is one of the values in Table 8-137.

8.4.2.73.5 Radio Information subelement

The Radio Information subelement contains radio information. The format of the Radio Information subelement is shown in Figure 8-315.

The Subelement ID field contains the value for Radio Information as defined in Table 8-153.

The Length field is 5.

The Transmit Power field is the transmit power used to transmit the current Location Track Notification frame containing the Location Parameters element with the Radio Information subelement and is a signed integer, 1 octet in length, reported in dBm. A value of –128 indicates that the transmit power is unknown. The tolerance for the transmit power value reported in the Radio Information subelement is ± 5 dB. This tolerance is defined as the maximum possible difference, in decibels, between the reported power value and the total transmitted power across all antennas of the STA, which are measured when transmitting Location Request frames.

The Antenna ID field is the identifying number for the antenna used to transmit the Location Request frame. The Antenna ID is defined in 8.4.2.42.

The Antenna Gain field is the antenna gain of the antenna (or group of antennas) over which the Location Track Notification frame is transmitted and is a signed integer, 1 octet in length, reported in dB. A value of –128 indicates that the antenna gain is unknown.

The RSNI field contains the RSNI value measured against the most recently received Location Configuration Request frame requesting that a Radio Information subelement be included in the Location Track Notification frame.
Track Notification frame. The RSNI value is defined in 8.4.2.43. A value of 255 indicates that the RSNI value is unknown or is not used.

The RCPI field contains the RCPI value measured against the most recently received Location Configuration Request frame requesting that a Radio Information subelement be included in the Location Track Notification frame. The RCPI value is defined in 8.4.2.40. A value of 255 indicates that the RCPI value is unknown or is not used.

**8.4.2.73.6 Motion subelement**

The Motion subelement contains motion information. The format of the Motion subelement is shown in Figure 8-316.

![Figure 8-316—Motion subelement](image)

The Subelement ID field contains the value for Motion as defined in Table 8-153.

The Length field is 8.

The Motion Indicator field is defined in Table 8-155. The mechanism that a STA uses to determine the value or transitions from one value to another of the Motion Indicator field is beyond the scope of the standard.

<table>
<thead>
<tr>
<th>Motion Indicator value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Stationary: the device is stationary and not in motion.</td>
</tr>
<tr>
<td>1</td>
<td>Start of motion: the device was stationary and is now in motion.</td>
</tr>
<tr>
<td>2</td>
<td>In motion: the device is and has been in motion.</td>
</tr>
<tr>
<td>3</td>
<td>End of motion: the device was in motion and is now stationary.</td>
</tr>
<tr>
<td>4</td>
<td>Unknown: information related to motion is unknown.</td>
</tr>
<tr>
<td>5–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The Bearing field, defined by a 2-octet unsigned integer, specifies the direction that the STA is traveling with relation to true north, increasing clockwise, measured in degrees from 0 degree to 359 degrees. If the Bearing value is unknown, the field is 65 535.

The Speed Units field contains the units for both Horizontal and Vertical Speed field, as defined in Table 8-156.
The Horizontal Speed field contains the horizontal speed of the STA expressed in the units indicated in the Speed Units field. If the Horizontal Speed value is unknown, the field is 65 535.

The Vertical Speed field is a two's complement signed integer indicating the vertical speed of the STA expressed in the units indicated in the Speed Units field. If the Vertical Speed value is unknown or greater than 32 766, the field is 32 767. If the Vertical Speed value is less than –32 767, the field is –32 768.

The Motion subelement field values are valid at the time of transmission of the Location Track Notification frame containing the subelement.

### 8.4.2.73.7 Location Indication Broadcast Data Rate subelement

The Location Indication Broadcast Data Rate subelement contains location reporting transmission rate information. The format of the Location Indication Broadcast Data Rate subelement format is shown in Figure 8-317.

![Figure 8-317—Location Indication Broadcast Data Rate subelement](image)

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Broadcast Target Data Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

The Subelement ID field contains the value for Location Indication Broadcast Data Rate as defined in Table 8-153.

The value of the Length field is 4.

The Broadcast Target Data Rate field specifies the target data rate at which the STA transmits Location Track Notification frames. The Broadcast Target Data Rate field format is specified by the Rate Identification field defined in 8.4.1.32. A value of 0 indicates the STA transmits Location Track Notification frames at a rate chosen by the STA transmitting the Location Track Notification frames.

### 8.4.2.73.8 Time of Departure subelement

The Time of Departure subelement contains time of departure information for the Location Track Notification frame including the subelement. The format of the Time of Departure subelement is shown in Figure 8-318.

![Table 8-156—Speed Units](image)

<table>
<thead>
<tr>
<th>Speed Units Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Centimeters per second</td>
</tr>
<tr>
<td>1</td>
<td>Meters per second</td>
</tr>
<tr>
<td>2–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
The Subelement ID field contains the value for Time of Departure as defined in Table 8-153.

The value of the Length field is 8.

The TOD Timestamp field carried within a frame specifies when the first frame energy is sent by the transmitting port in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field. The reported TOD timestamp value is determined from the TIME_OF_DEPARTURE parameter within the PHY-TXSTART.confirm primitive.

The TOD RMS field specifies the RMS time of departure error in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field, where the time of departure error equals the difference between the TOD Timestamp field and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. TOD RMS field is determined from aTxPmdTxStartRMS in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field.

The TOD Clock Rate field contains the clock rate used to generate the TOD timestamp value reported in the TOD Timestamp field, and it is specified in units of MHz.

### 8.4.2.73.9 Location Indication Options subelement

The Location Indication Options subelement contains the options for the STA when transmitting the Location Track Notification frame. The format of the Location Indication Options subelement is shown in Figure 8-319.

The Subelement ID field contains the value for Location Indication Options as defined in Table 8-153.

The Length field is 1 plus the length of each Indication Parameter included.

The Options Used field specifies which Indication Parameter fields in the Location Indication Options subelement are used. The format of the Options Used field is shown in Figure 8-320.
The Indication Parameters field defines a sequence of optional fields that are included in the Location Indication Options subelement based on the Options Used field value. The value of the Indication Parameters field is defined in Table 8-157.

**Table 8-157—Indication Parameter values**

<table>
<thead>
<tr>
<th>Order</th>
<th>Field length</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>Beacon Measurement Mode</td>
<td>The Beacon Measurement Mode field is the mode of beacon measurement, as defined in Table 8-64. The results of the beacon measurement are included in the Location Track Notification frame, as described in 8.5.8.17 and 10.23.4.2.</td>
</tr>
<tr>
<td>2–8</td>
<td></td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**8.4.2.74 Nontransmitted BSSID Capability element**

The format of the Nontransmitted BSSID Capability element is shown in Figure 8-321.

The Element ID field is equal to the Nontransmitted BSSID Capability value in Table 8-54.

The value of the Length field is 2.

The Nontransmitted BSSID Capability field contains the Capability information field of the BSS.

The Nontransmitted BSSID Capability element is included in the Nontransmitted BSSID profile subelement of the Multiple BSSID element defined in 8.4.2.48. The use of the Multiple BSSID element is described in 10.11.14 and Nontransmitted BSSID Advertisement procedures are described in 10.1.3.6.

**8.4.2.75 SSID List element**

The format of the SSID List element is shown in Figure 8-322.

The Element ID field is equal to the SSID List value in Table 8-54.

The value of the Length field is the length of the SSID list (variable) in octets.
The SSID List field is a list of SSID elements, each including the element ID, length field and SSID information field (see 8.4.2.2) for which the STA is requesting information.

The SSID List element is included in Probe Request frames, as described in 8.3.3.9. The use of the SSID List element and frames is described in 10.1.4.

**8.4.2.76 Multiple BSSID-Index element**

The format of the Multiple BSSID-Index element is shown in Figure 8-323.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>BSSID Index</th>
<th>DTIM Period (optional)</th>
<th>DTIM Count (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0 or 1</td>
</tr>
</tbody>
</table>

*Figure 8-323—Multiple BSSID-Index element format*

The Element ID field is equal to the Multiple BSSID-Index value in Table 8-54.

The value of the Length field is 1 octet when the Multiple BSSID-Index element is included in the Probe Response frame and otherwise is three octets.

The BSSID Index field is a value between 1 and $2^n - 1$ that identifies the nontransmitted BSSID, where $n$ is a nonzero, positive integer value.

The DTIM Period field is the DTIM period field for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The DTIM Count field is the DTIM count field for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The Multiple BSSID-index element is included in the nontransmitted BSSID profile element, as described in 10.1.3.6. The use of the Multiple BSSID element and frames is described in 10.11.14.

**8.4.2.77 FMS Descriptor element**

The FMS Descriptor element defines information about group addressed BUs buffered at the AP. It is present in the Beacon frames when dot11MgmtOptionFMSActivated is true. The format of the FMS Descriptor element is shown in Figure 8-324.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Number of FMS Counters</th>
<th>FMS Counters</th>
<th>FMSIDs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>n</td>
<td>m</td>
</tr>
</tbody>
</table>

*Figure 8-324—FMS Descriptor element format*

The Element ID field is equal to the FMS Descriptor value in Table 8-54.

The Length field is 1 if no FMS streams are accepted at the AP or is $1 + n + m$, where $n$ is the number of FMS Counters present and $m$ indicates the number of 1-octet FMSIDs present in the element.
The Number of FMS Counters field defines the number of FMS Counters fields that are contained in the FMS Descriptor element.

The FMS Counters field contains zero or more FMS Counters. The format of the FMS Counter is shown in Figure 8-325. When one or more FMS streams are accepted at the AP, at least one FMS counter is present in the FMS Descriptor element. A maximum of eight FMS counters are permitted. The FMS counters are used by the non-AP STA to identify the DTIM beacon after which group addressed BUs assigned to a particular delivery interval are transmitted. A single FMS Counter is shared by all FMS streams that use the same delivery interval.

```
+-----+-----+-----+-----+
| B0  | B2  | B3  | B7  |
| FMS Counter ID | Current Count |
+-----+-----+-----+-----+
```

**Figure 8-325—FMS Counter format**

The FMS Counter ID field is a 3-bit value that represents the counter ID assigned by the AP for a particular FMS stream.

The Current Count field indicates how many DTIM Beacon frames (including the current one) appear before the next DTIM Beacon frame after which the group addressed BUs assigned to a particular delivery interval are scheduled to be transmitted. The Current Count field is 0 on transmission and ignored upon reception when the FMS Counter field is included in the FMS Status subelement.

The FMSIDs field contains zero or more FMSIDs. Each FMSID is a 1-octet identifier assigned by the AP. Inclusion of an FMSID indicates the AP has buffered BUs for the corresponding group addressed stream that is scheduled for transmission immediately after the DTIM Beacon frame.

The FMS Descriptor element is included in Beacon frames, as described in 8.3.3.2. The use of the FMS Descriptor element and frames is described in 10.2.1.16.

### 8.4.2.78 FMS Request element

The FMS Request element defines information about the group addressed frames being requested by the non-AP STA. The format of FMS Request element is shown in Figure 8-326.

```
+-----+-----+-----+-----+-----+-----+
| Element ID | Length | FMS Token | Request subelements |
| Octets: | 1 | 1 | 1 | variable |
```

**Figure 8-326—FMS Request element format**

The Element ID field is the FMS Request value in Table 8-54.

The value of the Length field is 1 + n, where n indicates the total length of all FMS subelements contained in the element.
The FMS Token field contains a unique identifier for the FMS Stream Set that is the set of FMS subelements specified in the request. If this is a new request, then the FMS Token value is 0. Otherwise, the FMS Token value is the value assigned by the AP in the FMS Response element. The FMS Token is fixed for the lifetime of the FMS Stream Set.

The Request Subelements field contains one or more Request subelements described in Table 8-158.

### Table 8-158—Request subelements

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Subelement name</th>
<th>Length (in octets)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>FMS subelement</td>
<td>6 to 254</td>
</tr>
<tr>
<td>2–220</td>
<td>Reserved</td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Vendor Specific subelement</td>
<td>5 to 254</td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

The format of the FMS subelement is shown in Figure 8-327.

![Figure 8-327—FMS Subelement format](image)

The Subelement ID field is 1 to uniquely identify this subelement as the FMS subelement.

The value of the Length field is the sum of the lengths of the TCLAS element(s) plus 6 and the optional TCLAS Processing element, if present.

The Delivery Interval field defines the periodicity of stream transmission in units of DTIMs. The default value is 1. The value set to 0 indicates that requesting non-AP STA does not use the FMS stream identified by the TCLAS elements anymore.

The Max Delivery Interval field defines the maximum delivery interval the non-AP STA supports for the requested stream in units of DTIMs. The value set to 0 indicates that the non-AP STA is willing to accept any maximum delivery interval supported by the AP.

The Rate Identification field specifies the data rate as described in 8.4.1.32, at which the STA requests to receive group addressed frames. If the STA does not request a particular multicast rate, the Rate Identification field is 0.
The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the FMS Request element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The FMS Request element is included in FMS Request frames, as described in 8.5.14.11. The use of the FMS Request element and frames is described in 10.2.1.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

### 8.4.2.79 FMS Response element

The FMS Response element provides information about the delivery of group addressed frames. The format of the FMS Response element is shown in Figure 8-328.

![Figure 8-328—FMS Response element format](image)

The Element ID field is the FMS Response value in Table 8-54.

The Length field is $1 + n$, where $n$ indicates the total length of all FMS Status subelements contained in the element.

The FMS Token field is assigned by the AP for the set of FMS streams that share the counter identified by the FMS Counter ID maintained in the AP.

The Status Subelements field contains one or more Status subelements described in Table 8-159.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Subelement name</th>
<th>Length (in octets)</th>

</tr>
</tbody>
</table>

*Figure 8-329—FMS Status Subelement format*

The Subelement ID field is 1 to uniquely identify this subelement as the FMS Status subelement.

The value of the Length field is 15.

The Element Status field indicates the status of STA’s requested delivery interval, as indicated in Table 8-160, provided by the AP.

*Table 8-160—FMS Element Status and TFS Response Status definition*

<tr>
<td>14</td>
<td>Alternate Preferred, due to AP unable to provide requested TCLAS-based classifiers.</td>
</tr>
<tr>
<td>15–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The Delivery Interval field defines the minimum integer of DTIM periods between successive transmissions of frames for the stream corresponding to that FMSID.

The Max Delivery Interval field defines the maximum delivery interval the AP uses for the stream corresponding to FMSID. The value set to 0 indicates that the AP has no maximum delivery interval for the stream identified by FMSID.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.
The format of the FMS Counter field is shown in Figure 8-325.

The Rate Identification field specifies the data rate as described in 8.4.1.32 to be used for the multicast service. If the value of the Rate Identification field is 0 then the data rate is undefined.

The Multicast MAC Address field contains the MAC address of the multicast traffic to which this FMS response relates.

The format of the TCLAS Status subelement is shown in Figure 8-330.

The Subelement ID field is 2 to uniquely identify this subelement as the TCLAS Status subelement.

The value of the Length field is 1 plus the sum of the lengths of the TCLAS element(s) plus the optional TCLAS Processing element, if present.

The TCLASID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the FMS Response element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The FMS Response element is included in FMS Response frames, as described in 8.5.14.12. The use of the FMS Response element and frames is described in 10.2.1.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.80 QoS Traffic Capability element

The QoS Traffic Capability element provides information about types of traffic generated by a non-AP QoS STA, and is used by a QoS AP to indicate the access categories of associated non-AP QoS STAs. The format of the QoS Traffic Capability element is shown in Figure 8-331.
The Element ID field is the QoS Traffic Capability value in Table 8-54.

The value of the Length field is 1 + \( n \), where \( n \) equals the total number of nonzero bits in Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field.

The format of QoS Traffic Capability Bitmask/Flags field is defined in Table 8-161.

Table 8-161—QoS Traffic Capability Bitmask/Flags definition

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

<td>UP 5 Traffic</td>
</tr>
<tr>
<td>6</td>
<td>UP 6 Traffic</td>
</tr>
<tr>
<td>7</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

Bits 0–1 serve as QoS Traffic Capability Bitmask. The bitmask indicates the AC values that have the station count specified in the following AC STA Count List. An AP sets the bit to 1 to indicate that the station count for the corresponding AC is present in the AC STA Count List field. An AP sets the bit to 0 to indicate that the station count for the corresponding AC is not present in the AC STA Count List field. A non-AP STA always sets Bits 0–1 to 0. An AP ignores Bits 0–1 on reception.

Bits 4–6 serve as QoS Traffic Capability Flags. Each of Bits 4–6 serves as a flag for a non-AP STA to indicate application requirements about the user priorities of the traffic it generates. A non-AP STA sets the bit to 1 to indicate the existence of an application that requires generation of traffic belonging to the corresponding user priority (UP). A non-AP STA sets the bit to 0 to indicate that such application does not exist. An AP always sets Bits 4–6 to 0. A non-AP STA ignores Bits 4–6 on reception.

Bits 2–3 and Bit 7 are reserved.

The AC STA Count List comprises a sequence of STA Count fields corresponding to the nonzero bits in the Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field. The STA Count field is 1 octet long and contains an unsigned integer, encoded according to 8.2.2. The STA Count field specifies the number of associated QoS STAs that have indicated QoS Traffic Capability of the corresponding AC. If the number of STAs is greater than 255, the STA Count field is 255. The AC STA Count List field is present only when the QoS AP transmits the QoS Traffic Capability element.

The QoS Traffic Capability element is included in Beacon frames, as described in 8.3.3.2; Probe Response frames, as described in 8.3.3.10; Association Request frames, as described in 8.3.3.5; and Reassociation Request frames, as described in 8.3.3.7.
8.4.2.81 BSS Max Idle Period element

The BSS Max Idle Period element contains the time period a non-AP STA can refrain from transmitting frames to the AP before the AP disassociates the STA due to inactivity. The format of the BSS Max Idle Period element is shown in Figure 8-332.

| Octets: | 1 | 1 | 2 | 1 |
| Element ID | Length | Max Idle Period | Idle Options |

**Figure 8-332—BSS Max Idle Period element format**

The Element ID field is the BSS Max Idle Period value in Table 8-54.

The value of the Length field is 3.

The Max Idle Period field indicates the time period during which a STA can refrain from transmitting frames to its associated AP without being disassociated. The Max Idle Period field is a 16-bit unsigned integer. The time period is specified in units of 1000 TUs. The value of 0 is reserved. A non-AP STA is considered inactive if the AP has not received a data frame or management frame of a frame exchange sequence initiated by the STA for a time period equal to or greater than the time specified by the Max Idle Period field value.

The Idle Options field indicates the options associated with the BSS Idle capability. The Idle Options field is shown in Figure 8-333.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1-B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protected Keep-Alive Required</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**Figure 8-333—Idle Options field**

The Protected Keep-Alive Required bit set to 1 indicates that the STA sends an RSN protected frame to the AP to reset the Idle Timer at the AP for the STA, as defined in 10.23.12. If the Protected Keep-Alive Required bit is 0, the STA sends either an unprotected or a protected frame to the AP to reset the Idle Timer at the AP.

The BSS Max Idle Period element is included in Association Response frames, as described in 8.3.3.6, and Reassociation Response frames, as described in 8.3.3.8. The use of the BSS Max Idle Period element and frames is described in 10.23.12.

8.4.2.82 TFS Request element

The TFS Request element defines information about the traffic filters that are enabled at the AP for the requesting non-AP STA. The format of the TFS Request element is defined in Figure 8-334.
The Element ID field is equal to the TFS Request value in Table 8-54.

The Length field is \(2 + n\), where \(n\) indicates the total length of all TFS subelements contained in the element.

The TFS ID field is assigned by the STA and provides a unique identifier for the set of traffic filters specified in the TFS subelements.

The TFS Action Code field defines the actions taken at the AP when a frame matches a traffic filter. The functions of the bits in this field are shown in Table 8-162.

The TFS Request Subelements field contains one or more TFS Request subelements described in Table 8-163.
The format of the TFS subelement is shown in Figure 8-335.

The Subelement ID field uniquely identifies this subelement to be the TFS subelement. The value of this field is 1.

The value of the Length field is the sum of the lengths of the TCLAS element(s) plus the optional TCLAS Processing element, if present.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the TFS Request element is less than 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The TFS Request element is included in TFS Request frames, as described in 8.5.14.15, and WNM-Sleep Mode Request frames, as described in 8.5.14.18. The use of the TFS Request element and frames is described in 10.23.11.

**8.4.2.83 TFS Response element**

The TFS Response element defines information about the status of the requested traffic filter. The format of the TFS Response element is defined in Figure 8-336.

The Element ID field is equal to the TFS Response value in Table 8-54.

The Length field is $4n$, where $n$ indicates the total number of TFS Status subelements contained in the element.
The Status Subelement field contains one or more Status subelements described in Table 8-164.

### Table 8-164—Status subelements

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Subelement name</th>
<th>Length (in octets)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TFS Status subelement</td>
<td>4 to 254</td>
</tr>
<tr>
<td>2</td>
<td>TFS subelement</td>
<td>5 to 254</td>
</tr>
<tr>
<td>221</td>
<td>Vendor Specific subelement</td>
<td>5 to 254</td>
</tr>
<tr>
<td>0, 3 to 220, 222 to 255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

The TFS Status Subelement field contains the information as defined in Figure 8-337.

![Figure 8-337—TFS Status Subelement format](image)

The Subelement ID field uniquely identifies this subelement to be the TFS Status subelement. The value of this field is 1.

The value of the Length field is 2.

The TFS Response Status field indicates the status returned by the AP responding to the STA’s requested traffic filter, as indicated in Table 8-160.

The TFS ID field indicates the unique ID for the TFS traffic filter set.

The TFS Response element is included in TFS Response frames, as described in 8.5.14.16, and WNM-Sleep Mode Response frames, as described in 8.5.14.19. The use of the TFS Response element and frames is described in 10.23.11.

### 8.4.2.84 WNM-Sleep Mode element

The WNM-Sleep Mode element is used to enter and exit the WNM-Sleep mode. The format of the WNM-Sleep Mode element is shown in Figure 8-338.

![Figure 8-338—WNM-Sleep Mode element format](image)

The Element ID field is equal to the WNM-Sleep Mode value in Table 8-54.

The value of the Length field is 4.
The Action Type field is a number that identifies the type of WNM-Sleep mode request and response. The Action Types are shown in Table 8-165.

### Table 8-165—Action Type definitions

<table>
<thead>
<tr>
<th>Name</th>
<th>Action Type value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter WNM-Sleep Mode</td>
<td>0</td>
</tr>
<tr>
<td>Exit WNM-Sleep Mode</td>
<td>1</td>
</tr>
<tr>
<td>Reserved</td>
<td>2–255</td>
</tr>
</tbody>
</table>

The WNM-Sleep Mode Response Status field indicates the status returned by the AP responding to the non-AP STA’s WNM-Sleep mode request as defined in Table 8-166. This field is valid only in the WNM Sleep Mode element in a WNM-Sleep Mode Response frame and is reserved otherwise.

### Table 8-166—WNM-Sleep Mode Response Status definition

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Enter/Exit WNM-Sleep Mode Accept.</td>
</tr>
<tr>
<td>1</td>
<td>Exit WNM-Sleep Mode Accept, GTK/IGTK update required.</td>
</tr>
<tr>
<td>2</td>
<td>Denied. The AP is unable to perform the requested action.</td>
</tr>
<tr>
<td>3</td>
<td>Denied temporarily. The AP is unable to perform the requested action at the</td>
</tr>
<tr>
<td></td>
<td>current time. The request can be submitted again at a later time.</td>
</tr>
<tr>
<td>4</td>
<td>Denied. Due to the pending key expiration.</td>
</tr>
<tr>
<td>5</td>
<td>Denied. The requested action was not granted due to other WNM services in use</td>
</tr>
<tr>
<td></td>
<td>by the requesting STA.</td>
</tr>
<tr>
<td>6–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The WNM-Sleep Interval field is reserved if the Action Type field is 1.

The WNM-Sleep Interval field indicates to the AP how often a STA in WNM-Sleep Mode wakes to receive Beacon frames, defined as the number of DTIM intervals. The value set to 0 indicates that the requesting non-AP STA does not wake up at any specific interval.

The WNM-Sleep Mode element is included in WNM-Sleep Mode Request frames, as described in 8.5.14.18, and WNM-Sleep Mode Response frames, as described in 8.5.14.19. The use of the WNM-Sleep Mode element and frames is described in 10.2.1.18.
8.4.2.85 TIM Broadcast Request element

The TIM Broadcast Request element contains information about the periodic TIM broadcast being requested by the non-AP STA. The format of the TIM Broadcast Request element is shown in Figure 8-339.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>TIM Broadcast Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-339—TIM Broadcast Request element format**

The Element ID field is equal to the TIM Broadcast Request value in Table 8-54.

The value of the Length field is 1.

The TIM Broadcast Interval field is the number of beacon periods between TIM frame transmissions. A value of 0 terminates the use of TIM Broadcast for the requesting station.

The TIM Broadcast Request element is included in TIM Broadcast Request frames, as described in 8.5.14.20; Association Request frames, as described in 8.3.3.5; and Reassociation Request frames, as described in 8.3.3.7. The use of the TIM Broadcast Request element and frames is described in 10.2.1.17.

8.4.2.86 TIM Broadcast Response element

The TIM Broadcast Response element contains information about the periodic TIM broadcast by the AP. The format of the TIM Broadcast Response element is shown in Figure 8-340.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Status</th>
<th>TIM Broadcast Interval (optional)</th>
<th>TIM Broadcast Offset (optional)</th>
<th>High Rate TIM Rate (optional)</th>
<th>Low Rate TIM Rate (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>0 or 1</td>
<td>0 or 4</td>
<td>0 or 2</td>
<td>0 or 2</td>
</tr>
</tbody>
</table>

**Figure 8-340—TIM Broadcast Response element format**

The Element ID field is equal to the TIM Broadcast Response value in Table 8-54.

The value of the Length field is 1 or 10, depending on the presence of a TIM Broadcast schedule (TIM Broadcast Interval, TIM Broadcast Offset, High Rate TIM Rate, and Low Rate TIM Rate).

The Status field indicates the status of the AP responding to the STA’s requested delivery interval, as indicated in Table 8-167.

When the Status field is 0, 1, or 3, the TIM Broadcast Interval field, TIM Broadcast Offset field, High Rate TIM Rate field, and Low Rate TIM Rate field are included in the TIM Broadcast Response element.
The TIM Broadcast Interval field contains the number of beacon periods between scheduled TIM frame transmissions.

The TIM Broadcast Offset field contains the offset in microseconds with a tolerance of ± 4 microseconds relative to the TBTT for which a TIM frame is scheduled for transmission. The field contains a signed integer.

The High Rate TIM Rate field provides an indication of the rate that is used to transmit the high data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the high rate TIM frame is not transmitted.

The Low Rate TIM Rate field provides an indication of the rate that is used to transmit the low data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the low rate TIM frame is not transmitted.

The TIM Broadcast Response element is included in TIM Broadcast Response frames, as described in 8.5.14.21; Association Response frames, as described in 8.3.3.6; and Reassociation Response frames, as described in 8.3.3.8. The use of the TIM Broadcast Response element and frames is described in 10.2.1.17.

### 8.4.2.87 Collocated Interference Report element

The Collocated Interference Report element contains some characteristics of the reported collocated interference. The Collocated Interference Report element is defined in Figure 8-341.

<table>
<thead>
<tr>
<th>Field value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Octets</th>
<th>Interference Interval</th>
<th>Interference Burst Length</th>
<th>Interference Start Time/Duty Cycle</th>
<th>Interference Center Frequency</th>
<th>Interference Bandwidth</th>
</tr>
</thead>
</table>

### Figure 8-341—Collocated Interference Report element format

The Element ID field is equal to the Collocated Interference Report value in Table 8-54.
The Report Period field contains an unsigned integer value in units of 200 TUs. If the Report Period field is a value that is greater than 0, then the reporting is periodic, and the field contains the period of sending the report. If the Report Period field is 0, then the reporting is not periodic, and a report is generated when the STA knows of a change in the collocated interference. See 10.23.8 for further details.

The Interference Level field is a two's complement signed integer indicating the maximum level of the collocated interference power in units of dBm over all receive chains averaged over a 4 μs period during an interference period and across interference bandwidth. When the interference level is unknown, the field is +127 dBm. When the interference level is equal or greater than 126 dBm, the field is +126 dBm. If no collocated interference is present the field is –128 dBm. When the interference level is equal or lower than –127 dBm, the field is –127 dBm. The interference level is referenced to the antenna connector (see “antenna connector” in 3.1) used for reception, like RCPI.

The Interference Level Accuracy/Interference Index field is shown in Figure 8-342.

```
+------------------+-------------------+
| Expected Accuracy | Interference Index |
+------------------+-------------------+
```

**Figure 8-342—Interference Level Accuracy/Interference Index field format**

The Expected Accuracy field represents an unsigned integer indicating the expected accuracy of the estimate of interference in dB with 95% confidence interval. If the Interference Level field is X (dBm) and the expected accuracy field is Y (dB), the actual interference level is in the range of [X – Y, X + Y] with the probability of 95%. The range of expected accuracy is from 0 dB to 14 dB. If accuracy is unknown or greater than 14 dB, then the Expected Accuracy field is 15.

The Interference Index field indicates the interference index that is unique for each type of interference source. The field set to 0 indicates that no collocated interference is present. See 10.23.8 for further details.

The Interference Interval field indicates the interval between two successive periods of interference in microseconds. When the interval between two successive periods of interference is variable the field is $2^{32} - 1$. When the interval between two successive periods of interference is equal or greater than $2^{32} - 2$ the field is $2^{32} - 2$. If no collocated interference is present, the field is 0.

The Interference Burst Length field indicates the duration of each period of interference in microseconds. When the duration of each period of interference is variable the field is $2^{32} - 1$. When the duration of each period of interference is equal or greater than $2^{32} - 2$ the field is $2^{32} - 2$. If no collocated interference is present, the field is 0.

The Interference Start Time/Duty Cycle field contains the least significant 4 octets (i.e., B0–B31) of the TSF timer at the start of the interference burst. When either the Interference Interval or the Interference Burst Length fields are set to $2^{32} - 1$, this field indicates the average duty cycle. The average duty cycle value is defined as follows:

$$\text{Average duty cycle} = \text{Round-to-Integer} \left( \left(2^{32} - 2 \right) \times \left( \frac{T_B}{T_I} \right) \right)$$

where

- $T_B$ is the average interference burst length
- $T_I$ is the average interference interval
When the interference is nonperiodic or no collocated interference is present, the Interference Start Time field is 0.

The Interference Center Frequency field indicates the center frequency of interference in units of 5 kHz. When center frequency is unknown, the center frequency of the STA’s operating channel is reported. If no collocated interference is present the field is 0.

The Interference Bandwidth field indicates the bandwidth in units of 5 kHz at the –3 dB roll-off point of the interference signal. When bandwidth of the interference signal is unknown, the field is 65 535. When bandwidth of the interference signal is equal or greater than 65 534 the field is 65 534. If no collocated interference is present, the field is 0.

### 8.4.2.88 Channel Usage element

The Channel Usage element defines the channel usage information for noninfrastructure networks or an off channel TDLS direct link. The format of the Channel Usage element is shown in Figure 8-343.

The Element ID field is equal to the Channel Usage value in Table 8-54.

The Length field is $2n + 1$, where $n$ indicates the total number of Channel Entry subelements contained in the element.

The Usage Mode field is a number that identifies the usage of the recommended channels listed in the Operating Class/Channel Number pair fields. The Usage Mode definitions are shown in Table 8-168.

#### Table 8-168—Usage Mode definitions

<table>
<thead>
<tr>
<th>Value</th>
<th>Usage Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Noninfrastructure IEEE 802.11 network</td>
</tr>
<tr>
<td>1</td>
<td>Off-channel TDLS direct link</td>
</tr>
<tr>
<td>2–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The Channel Entry field includes zero or more Operating Class and Channel pairs. The format of Channel Entry field is shown in Figure 8-313.

The Channel Usage element may be included in Probe Request frames, as described in 8.3.3.9; Probe Response frames, as described in 8.3.3.10; Channel Usage Request frames, as described in 8.5.14.23; and Channel Usage Response frames, as described in 8.5.14.24. The use of the Channel Usage element and frames is described in 10.23.14.
8.4.2.89 Time Zone element

The Time Zone element contains the local time zone of the AP. The format of the Time Zone element is shown in Figure 8-344.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Time Zone</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-344—Time Zone element format**

The Element ID field is the Time Zone value in Table 8-54.

The value of the Length field is variable.

The format of the Time Zone field is as specified in 8.3 of IEEE Std 1003.1-2004:

```
stdoffset[dst[offset][,start[/time],end[/time]]]
```

The length of the field is no less than 4 octets and no more than TZNAME_MAX, as defined in IEEE Std 1003.1-2004. The Time Zone field represents the time zone at the AP’s location. The encoding of the field is in ASCII characters as shown in the following Example-1.

Example-1: EST5

Example-2: EST5EDT4,M3.2.0/02:00,M11.1.0/02:00

In the Example-2, the string is interpreted as a time zone that is normally five hours behind UTC, and four hours behind UTC during DST, which runs from the second Sunday in March at 02:00 local time through the first Sunday in November at 02:00 local time. Normally, the time zone is abbreviated “EST” but during DST it is abbreviated “EDT.”

8.4.2.90 DMS Request element

The DMS Request element defines information about the group addressed frames to be transmitted as individual addressed frames. The format of the DMS Request element is shown in Figure 8-345.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>DMS Descriptor List</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-345—DMS Request element format**

The Element ID field is the DMS Request value in Table 8-54.

The value of the Length field is the length of the DMS Descriptor List field.
The DMS Descriptor List field contains one or more DMS Descriptors. The format of the DMS Descriptor is defined in Figure 8-346.

The DMSID field is set to 0 when the Request Type field is “Add” as defined in Table 8-169; otherwise, the DMSID field is set to the nonzero value assigned by the AP STA to identify the DMS traffic flow.

The DMS Length field is set to 1 + \( n \), where \( n \) indicates the total length in octets of all the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Descriptor field.

The Request Type field identifies the type of DMS request. The Request Types are shown in Table 8-169.

![Figure 8-346—DMS Descriptor](image)

<table>
<thead>
<tr>
<th>Octets:</th>
<th>DMSID</th>
<th>DMS Length</th>
<th>Request Type</th>
<th>TCLAS Elements</th>
<th>TCLAS Processing Element (optional)</th>
<th>TSPEC Element (optional)</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>variable</td>
<td>0 or 3</td>
<td>0 or 57</td>
<td>variable</td>
<td></td>
</tr>
</tbody>
</table>

The Request Type field contains “Add,” the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 8.4.2.33. When the Request Type field contains any value other than “Add,” the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains “Add” and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 8.4.2.35. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains “Add” or “Change,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 8.4.2.32. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.

<table>
<thead>
<tr>
<th>Description</th>
<th>Request Type value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>0</td>
</tr>
<tr>
<td>Remove</td>
<td>1</td>
</tr>
<tr>
<td>Change</td>
<td>2</td>
</tr>
<tr>
<td>Reserved</td>
<td>3–255</td>
</tr>
</tbody>
</table>

When the Request Type field contains “Add,” the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 8.4.2.33. When the Request Type field contains any value other than “Add,” the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains “Add” and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 8.4.2.35. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains “Add” or “Change,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 8.4.2.32. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.
The Subelement ID field values for the defined optional subelements are shown in Table 8-170. A Yes in the Extensible column of a subelement listed in Table 8-170 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–220</td>
<td>Reserved</td>
<td></td>

</tr>
<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>3 to 248</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The DMS Request element is included in DMS Request frames, as described in 8.5.14.25, and Reassociation Request frames, as described in 8.3.3.7. The use of the DMS Request element and frames is described in 10.23.15.

8.4.2.91 DMS Response element

The DMS Response element provides the status information about the requested group addressed frames. The format of the DMS Response element is shown in Figure 8-347.

The Element ID field is the DMS Response value in Table 8-54.

The value of the Length field is the total length of the DMS Status List field.

The DMS Status List field contains one or more DMS Status field. The format of the DMS Status field is defined in Figure 8-348.
The DMSID field is assigned by the AP and provides a unique identifier within the BSS for the DMS traffic flow identified by the TCLAS Elements, TCLAS Processing Element, and TSPEC Element fields. The uniqueness of the identifier is independent of the ordering of the TCLAS elements.

The value of the DMS Length field is set to $3 + n$, where $n$ indicates the total length in octets of all the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Status field. When the Response Type field is set to “Terminate,” the value of the DMS Length field is set to 3.

The Response Type field indicates the response type returned by the AP responding to the non-AP STA’s request, as indicated in Table 8-171.

<table>
<thead>
<tr>
<th>Field value</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Accept</td>
<td>AP accepts the DMS request</td>
</tr>
<tr>
<td>1</td>
<td>Denied</td>
<td>AP rejects the DMS request</td>
</tr>
<tr>
<td>2</td>
<td>Terminate</td>
<td>AP terminates DMS previously accepted DMS request</td>
</tr>
<tr>
<td>3–255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

When the Last Sequence Control field is not supported the Last Sequence Control field is set to 65 535. When the Last Sequence Control field is supported and the Response Type field does not contain “Terminate,” the Last Sequence Control field is reserved.

When the Response Type field is “Terminate” and the Last Sequence Control field is supported, Bit 0 to Bit 3 of the Last Sequence Control field is 0, and Bit 4 to Bit 15 of the Last Sequence Control field contains the sequence number of the last group addressed frame that the AP converted to an individually addressed frame and sent successfully to the non-AP STA that is the recipient of the DMS Response frame. If this last frame received by the non-AP STA prior to DMS termination has not also been sent using a group addressed frame, the Last Sequence Control field is set to 65 534.

When the Response Type field contains “Accept” or “Denied,” the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 8.4.2.33. Otherwise, the TCLAS Elements field contains zero TCLAS elements.

When the Response Type field contains “Accept” or “Denied,” the TCLAS Processing Element field optionally contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 8.4.2.35. When the Response Type field contains “Terminate” or when there is only one TCLAS element, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Response Type field contains “Accept” or “Denied,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 8.4.2.32. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.
The Subelement ID field values for the defined optional subelements are shown in Table 8-172. A Yes in the Extensible column of a subelement listed in Table 8-172 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

### Table 8-172—Optional Subelement IDs for DMS Status

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The DMS Response element is included in DMS Response frames, as described in 8.5.14.26, and Reassociation Response frames, as described in 8.3.3.8. The use of the DMS Response element and frames is described in 10.23.15.

#### 8.4.2.92 Destination URI element

The Destination URI element contains URI and ESS Detection Interval values from the requesting STA that the responding STA may use to deliver Event or Diagnostic Report frames. The format of the Destination URI element is given in Figure 8-349.

![Figure 8-349—Destination URI element format](image)

The Element ID field is equal to the Destination URI value in Table 8-54.

The value of the Length field is 1 plus the length of the URI field.

The ESS Detection Interval field is defined in 8.4.2.73.2 and its use for Event and Diagnostic requests is described in 10.23.2 and 10.23.3.

The URI field specifies the destination URI for Event and Diagnostic reports using the format defined in IETF RFC 3986. The URI field value is limited to 253 octets.

The Destination URI element is included as the last element in an Event or Diagnostic Request frame.

The Destination URI element is included in Event Request frames, as described in 8.5.14.2, or Diagnostic Request frames, as described in 8.5.14.4.

Use of the Destination URI element in an Event Request frame is described in 10.23.2.1. Use of the Destination URI element in a Diagnostic Request frame is described in 10.23.3.1.
8.4.2.93 U-APSD Coexistence element

The U-APSD Coexistence provides the duration of requested transmission during a U-APSD service period. The format of the U-APSD Coexistence element is shown in Figure 8-350.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>TSF 0 Offset</th>
<th>Interval/Duration</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>8</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-350—U-APSD Coexistence element format

The Element ID field is equal to the U-APSD Coexistence value in Table 8-54.

The value of the Length field is 12 plus the length of any additional subelements present.

A nonzero value of the TSF 0 Offset field is the number of microseconds since TSF time 0 when the non-AP STA knew the start of interference. The AP uses the TSF 0 Offset field together with the Interval/Duration field to enqueue frames for transmission to the non-AP STA using the procedures as described in 10.2.1.5.2.

A TSF 0 Offset field value of 0 indicates the non-AP STA requests the AP transmit frames to the non-AP STA using the procedure described in 10.2.1.5.2 for the case where TSF 0 Offset is equal to 0.

The Interval/Duration field is defined as follows:

— When the TSF 0 Offset is 0, the Interval/Duration field is the number of microseconds during the U-APSD service period when the AP transmits frames to the non-AP STA as described in 10.2.1.5.2.

— When the TSF 0 Offset is nonzero, the Interval/Duration field is the number of microseconds between the start of consecutive interference bursts.

The Interval/Duration field value of 0 is reserved.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-173. A Yes in the Extensible column of a subelement listed in Table 8-173 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-173—Optional Subelement IDs for U-APSD Coexistence

<table>
<thead>

8.4.2.94 Interworking element

The Interworking element contains information about the interworking service capabilities of a STA as shown in Figure 8-351.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Access Network Options</th>
<th>Venue Info (optional)</th>
<th>HESSID (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0 or 2</td>
</tr>
</tbody>
</table>

**Figure 8-351—Interworking element format**

The Length field is a 1-octet field whose value is 1 plus the sum of the lengths of each optional field present in the element.

The format of Access Network Options field is shown in Figure 8-352.

<table>
<thead>
<tr>
<th>Bits:</th>
<th>B0</th>
<th>B3</th>
<th>B4</th>
<th>B5</th>
<th>B6</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Access Network Type</td>
<td>Internet</td>
<td>ASRA</td>
<td>ESR</td>
<td>UESA</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-352—Access Network Options field format**

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)association Request frames. A mesh STA sets the Internet bit to 0 when including the Interworking element in Mesh Peering Open frames. In (Re)association Request frames, a non-AP STA sets the UESA bit according to the procedures in 10.3.5. The access network types are shown in Table 8-174. The Access Network Type field is set by the AP or the mesh STA to advertise its access network type to non-AP STAs. A non-AP STA uses this field to indicate the desired access network type in an active scan. See V.2 for informative text on usage of fields contained within the Interworking element.

**Table 8-174—Access network type**

<table>
<thead>
<tr>
<th>Access network type</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Private network</td>
<td>Nonauthorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which may employ user accounts. Private networks do not necessarily employ encryption.</td>
</tr>
<tr>
<td>1</td>
<td>Private network with guest access</td>
<td>Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users.</td>
</tr>
<tr>
<td>2</td>
<td>Chargeable public network</td>
<td>The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges may be available through other methods (e.g., IEEE 802.21, http/https redirect or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee.</td>
</tr>
</tbody>
</table>
Bit 4 is the Internet field. The AP or mesh STA sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. It is set to 0 whenever dot11RSNAActivated is true. For more information, refer to Network Authentication Type Information in 8.4.4.6. For a mesh STA the ASRA field is used as an emergency indicator. If a mesh STA requires emergency services, the ASRA field is set to 1; otherwise it is set to 0. See 10.24.6.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP or mesh STA to indicate that emergency services are reachable through the AP or mesh STA; otherwise it is set to 0 indicating that it is unable to reach the emergency services. See 10.24.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When set to 0, this field indicates that no unauthenticated emergency services are reachable through this AP or mesh STA. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP or mesh STA. A STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. A mesh STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to another mesh STA to access emergency services. See 10.3.5.

The Venue Info field is defined in 8.4.1.34.

The HESSID field, which is the identifier for a homogeneous ESS, specifies the value of HESSID; see 10.24.2. A STA uses this field to indicate the desired HESSID in an active scan per 10.1.4. The HESSID field for an AP is set to the value of dot11HESSID. This optional field is not used by mesh STAs.

### 8.4.2.95 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 8-353.
The Length field is a 1-octet field whose value is equal to the sum of the lengths of the Advertisement Protocol Tuple fields.

The format of Advertisement Protocol Tuple field is shown in Figure 8-354.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Advertisement Protocol Tuple #1</th>
<th>...</th>
<th>Advertisement Protocol Tuple # n (optional)</th>
</tr>
</thead>
</table>
```

Octets: 1 1 variable variable

**Figure 8-353—Advertisement Protocol element format**

The format of Advertisement Protocol Tuple field is shown in Figure 8-354.

```
<table>
<thead>
<tr>
<th>Query Response Info</th>
<th>Advertisement Protocol ID</th>
</tr>
</thead>
</table>
```

Octets: 1 variable

**Figure 8-354—Advertisement Protocol Tuple field format**

The format of Query Response Info field is shown in Figure 8-355.

```
<table>
<thead>
<tr>
<th>Bits: B0 B6 B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query Response Length Limit</td>
</tr>
</tbody>
</table>
```

**Figure 8-355—Query Response Info field format**

The Query Response Info field is defined as follows:

- The Query Response Length Limit indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. The Query Response Length Limit may be set to a value larger than the maximum MMPDU size in which case the Query Response spans multiple MMPDUs. The Query Response Length Limit is encoded as an integer number of 256 octet units. A value of 0 is not permitted. A value of 0x7F means the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 8.4.1.33). The requesting STA sets the Query Response Length Limit to 0 on transmission and the responding STA ignores it upon reception.

- Bit 7, the Preassociation Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the Advertisement Server, which is the non-AP STA’s peer for this Advertisement Protocol, will return a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to 0 to indicate that the Query Response may be dependent on the BSSID. See 10.24.3.1 for further information. Bit 7 is reserved for non-AP STAs.

The Advertisement Protocol ID is a variable-length field. When this field contains a vendor-specific Advertisement Protocol ID, then this field will be structured per the Vendor Specific element defined in 8.4.2.28, where the Element ID of the Vendor Specific element of 8.4.2.28 is the first octet of the field and contains the vendor-specific value for Advertisement Protocol ID defined in Table 8-175; otherwise its length is 1 octet and its value is one of the values in Table 8-175. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.
Table 8-175—Advertisement protocol ID definitions

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>

— ANQP supports information retrieval from an Advertisement Server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA might respond to queries with or without proxying the query to a server in an external network). See 10.24.3.2 for information on ANQP procedures.

— MIH Information Service is a service defined in IEEE Std 802.21-2008 to support information retrieval from an information repository.

— MIH Command and Event Services capability discovery is a mechanism defined in IEEE 802.21 (see IEEE Std 802.21-2008) to support discovering capabilities of command service and event service entities in a STA or an external network.

— The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL.

— Advertisement Protocol ID 221 is reserved for Vendor Specific Advertisement Protocols. When the Advertisement Protocol ID is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific element in 8.4.2.28.

8.4.2.96 Expedited Bandwidth Request element

The Expedited Bandwidth Request element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 8-356.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Precedence Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-356—Expedited Bandwidth Request element format

The Length field is 1.

The Precedence Level field is provided in Table 8-176.

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B3].

The first responders (public) in Table 8-176 are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.
The QoS Map Set element is transmitted from an AP to a non-AP STA in a (Re)association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality-of-service constructs to User Priorities defined by transmission of Data frames in this standard. This element maps the higher layer priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map Set element is shown in Figure 8-357.

The Length field is set to 16+2×n, where n is the number of Exception fields in the QoS Map set.

DSCP Exception fields are optionally included in the QoS Map Set. If included, the QoS Map Set has a maximum of 21 DSCP Exception fields. The format of the exception field is shown in Figure 8-358.

When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element.
The non-AP STA will first attempt to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.

— Each DSCP Exception field has a unique DSCP Value.

<table>

</tbody>
</table>

**Figure 8-359—DSCP Range description**

The QoS Map Set has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 8-359. The DSCP Range value is between 0 and 63 inclusive, or 255.

— The DSCP range for each user priority is nonoverlapping.
— The DSCP High Value is greater than or equal to the DSCP Low Value.
— If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

### 8.4.2.98 Roaming Consortium element

The Roaming Consortium element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 10.24.8. The element's format is shown in Figure 8-360.

<table>
<thead>
<tr>
<th>Octets:</th>
<th>Element ID</th>
<th>Length</th>
<th>Number of ANQP OIs</th>
<th>OI #1 and #2 Lengths</th>
<th>OI #1 (optional)</th>
<th>OI #2 (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>variable</td>
<td>variable</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-360—Roaming Consortium element format**

The Length field is a 1-octet field whose value is equal to 2 plus the sum of the number of octets in each OI field present.

The format of the Number of ANQP OIs field is a one-octet unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. A value of 0 means that no additional OIs will be returned in response to an ANQP query for the Roaming Consortium list. A value of 255 means that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 8-361.

— The value of the OI #1 Length subfield is the length in octets of the OI #1 field.
— The value of the OI #2 Length subfield is the length in octets of the OI #2 field. If the OI #2 field is not present, the value of the OI #2 Length subfield is set to 0.

**NOTE**—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.
The OI field is defined in 8.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The value of the OI(s) in this table are equal to the value of the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

8.4.2.99 Emergency Alert Identifier element

The Emergency Alert Identifier element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier element is provided in Figure 8-362.

\[
\text{AIH} = \text{HMAC-SHA1-64} (\text{“ES_ALERT”, Emergency_Alert_Message})
\]

Where AIH is then truncated to the first 64 bits of this function.

Emergency_Alert_Message is the EAS message itself.

8.4.2.100 Mesh Configuration element

8.4.2.100.1 General

The Mesh Configuration element shown in Figure 8-363 is used to advertise mesh services. It is contained in Beacon frames and Probe Response frames transmitted by mesh STAs, and is also contained in Mesh Peering Open and Mesh Peering Confirm frames.
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 7.

The remainder of the fields are described in the following subclauses.

### 8.4.2.100.2 Active Path Selection Protocol Identifier

The Active Path Selection Protocol Identifier field indicates the path selection protocol that is currently activated in the MBSS. Table 8-177 provides path selection protocol identifier values defined by this standard.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>Hybrid wireless mesh protocol (default path selection protocol) defined in 13.10 (default path selection protocol)</td>
</tr>
<tr>
<td>2–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active path selection protocol is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>

When the Active Path Selection Protocol Identifier field is 255, the active path selection protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

### 8.4.2.100.3 Active Path Selection Metric Identifier

The Active Path Selection Metric Identifier field indicates the path metric that is currently used by the active path selection protocol in the MBSS. Table 8-178 provides the path selection metric identifier values defined by this standard.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>Airtime link metric defined in 13.9 (default path selection metric)</td>
</tr>
<tr>
<td>2–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active metric is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>

When the Active Path Selection Metric Identifier field is 255, the active path metric is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)
8.4.2.100.4 Congestion Control Mode Identifier

The Congestion Control Mode Identifier field indicates the congestion control protocol that is currently activated in the MBSS. Table 8-179 provides the congestion control mode identifier values defined by this standard.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Congestion control is not activated (default congestion control mode)</td>
</tr>
<tr>
<td>1</td>
<td>Congestion control signaling protocol defined in 13.12.2</td>
</tr>
<tr>
<td>2–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active congestion control protocol is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>

The congestion mode identifier value of 0 indicates the mesh STA has no active congestion control protocol, and is set as the default value for the congestion control mode identifier in the MBSS.

When the Congestion Control Mode Identifier field is 255, the active congestion control protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.5 Synchronization Method Identifier

The Synchronization Method Identifier field indicates the synchronization method that is currently activated in the MBSS. Table 8-180 provides the synchronization method identifier values defined by this standard.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>Neighbor offset synchronization method defined in 13.13.2.2 (default synchronization method)</td>
</tr>
<tr>
<td>2–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active synchronization method is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>

The neighbor offset synchronization method is defined as the default synchronization method among mesh STAs. The details of the neighbor offset synchronization method are described in 13.13.2.2.

When the Synchronization Method Identifier field is 255, the active synchronization method is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)
8.4.2.100.6 Authentication Protocol Identifier

The Authentication Protocol Identifier field indicates the type of authentication protocol that is currently used to secure the MBSS. Table 8-181 provides the authentication protocol identifier values defined by this standard.

Table 8-181—Authentication Protocol Identifier field values

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No authentication method is required to establish mesh peerings within the MBSS</td>
</tr>
<tr>
<td>1</td>
<td>SAE defined in 11.3</td>
</tr>
<tr>
<td>2</td>
<td>IEEE 802.1X authentication</td>
</tr>
<tr>
<td>3–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active authentication protocol is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>

When the Authentication Protocol Identifier field is 255, the active authentication protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.7 Mesh Formation Info

The format of the Mesh Formation Info field is shown in Figure 8-364.

```
B0 B1 B6 B7
| Connected to Mesh Gate | Number of Peerings | Connected to AS |
```

Bits: 1 6 1

Figure 8-364—Mesh Formation Info field

The Connected to Mesh Gate subfield is set to 1, if the mesh STA has a mesh path to a mesh gate that announces its presence using GANN elements, RANN elements, or PREQ elements, and set to 0 otherwise.

The Number of Peerings subfield contains an unsigned integer that indicates the number of mesh peerings currently maintained by the mesh STA or 63, whichever is smaller.

The Connected to AS subfield is set to 1 if the Authentication Protocol Identifier field in the Mesh Configuration element is set to 2 (indicating IEEE 802.1X authentication) and the mesh STA has an active connection to an AS.

NOTE—When an AS is collocated with an IEEE 802.1X authenticator an active connection is implicitly true.
8.4.2.100.8 Mesh Capability

The Mesh Capability field comprises a set of values indicating whether a mesh STA is a possible candidate for mesh peering establishment. The details of the Mesh Capability field are shown in Figure 8-365.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Accepting Additional Mesh Peerings</th>
<th>MCCA Supported</th>
<th>MCCA Enabled</th>
<th>Forwarding</th>
<th>MBCA Enabled</th>
<th>TBTT Adjusting</th>
<th>Mesh Power Save Level</th>
<th>Reserved</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-365—Mesh Capability field

The Accepting Additional Mesh Peerings subfield is set to 1 if the mesh STA is willing to establish additional mesh peerings with other mesh STAs and set to 0 otherwise (i.e., the Accepting Additional Mesh Peerings subfield is set in accordance with dot11MeshAcceptingAdditionalPeerings). When the Mesh Configuration element is included in the Mesh Peering Open frame and in the Mesh Peering Confirm frame, the Accepting Additional Mesh Peerings subfield is set to 1.

The MCCA Supported subfield is set to 1 if the mesh STA implements MCCA and set to 0 otherwise (i.e., the MCCA Supported subfield is set in accordance with dot11MCCAImplemented).

The MCCA Enabled subfield is set to 1 if the mesh STA is using the MCCA and set to 0 otherwise (i.e., the MCCA Enabled subfield is set in accordance with dot11MCCAActivated).

The Forwarding subfield is set to 1 if the mesh STA forwards MSDUs and set to 0 otherwise (i.e., the Forwarding subfield is set in accordance with dot11MeshForwarding).

The MBCA Enabled subfield is set to 1 if the mesh STA is using MBCA, and is set to 0 otherwise (i.e., the MBCA Enabled subfield is set in accordance with dot11MBCAActivated). (See 13.13.4.)

The TBTT Adjusting subfield is set to 1 while the TBTT adjustment procedure is ongoing, and is set to 0 otherwise. (See 13.13.4.4.3.)

The Mesh Power Save Level subfield is set to 1 if at least one of the peer-specific mesh power modes is deep sleep mode and set to 0 otherwise. The Mesh Power Save Level subfield is reserved when the Power Management field in the Frame Control Field is set to 0. See 8.2.4.5.11.

8.4.2.101 Mesh ID element

The Mesh ID element is used to advertise the identification of an MBSS and is described in 13.2.2. The format of the Mesh ID element is shown in Figure 8-366. The Mesh ID element is transmitted in Mesh Peering Open frames, Mesh Peering Confirm frames, Mesh Peering Close frames, Beacon frames, and Probe Request and Response frames.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Mesh ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-366—Mesh ID element format
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is between 0 and 32 octets.

A Mesh ID field of length 0 indicates the wildcard Mesh ID, which is used within Probe Request frame.

Detailed usage of the Mesh ID element is described in 13.2.2.

8.4.2.102 Mesh Link Metric Report element

The Mesh Link Metric Report element is transmitted by a mesh STA to a neighbor peer mesh STA to indicate the quality of the link between the transmitting mesh STA and the neighbor peer mesh STA. The format of the Mesh Link Metric Report element is shown in Figure 8-367.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Flags</th>
<th>Link Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-367—Mesh Link Metric Report element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field indicates the number of octets in the Information field (fields following the Element ID and Length fields).

The format of the Flags field is shown in Figure 8-368.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>Reserved</td>
<td></td>
</tr>
<tr>
<td>Bits:</td>
<td>1</td>
<td>7</td>
</tr>
</tbody>
</table>

Figure 8-368—Flags field

The Flags field is set as follows:
- Bit 0: Request subfield (0 = not a request, 1 = link metric report request). A Request subfield equal to 1 indicates that the recipient of Mesh Link Metric Report element is requested to send a link metric report to the transmitter of the Mesh Link Metric Report element.
- Bit 1–7: Reserved.

The Link Metric field indicates the value of the link metric associated with the mesh link between the peer mesh STA transmitting the Mesh Link Metric Report and the neighbor mesh STA receiving the Mesh Link Metric Report. The length and the data type of the Link Metric field are determined by the active path selection metric identifier (see 8.4.2.100.3). The length and the data type for the airtime link metric are given in Table 13-5 in 13.9.

8.4.2.103 Congestion Notification element

The Congestion Notification element is used to indicate the congestion status of the mesh STA per mesh destination and AC, and the duration for which the STA expects the congestion to last. The format of the Congestion Notification element is shown in Figure 8-369. The Congestion Notification element is included in Congestion Control Notification frames, as described in 8.5.17.5.
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 14.

The Destination Mesh STA Address field is represented as a 48-bit MAC address and is set to the address of the mesh destination for which the intra-mesh congestion control is applied. It is set to the broadcast address if the intra-mesh congestion control is applied to all destinations.

The element contains four Congestion Notification Duration fields for the four EDCA access categories to indicate the estimated congestion duration per AC at the mesh STA transmitting the congestion notification. The congestion notification duration values are encoded as unsigned integers in units of 100 µs.

### 8.4.2.104 Mesh Peering Management element

The Mesh Peering Management element is used to manage a mesh peering with a neighbor mesh STA. The format of the Mesh Peering Management element is shown in Figure 8-370.

```
<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Mesh Peering Protocol Identifier</th>
<th>Local Link ID</th>
<th>Peer Link ID (conditional)</th>
<th>Reason Code (conditional)</th>
<th>Chosen PMK (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>
```

**Figure 8-370—Mesh Peering Management element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to the number of octets in the Mesh Peering Management element following the Length field itself.

The Mesh Peering Protocol Identifier field indicates the type of mesh peering protocol that is currently used to establish mesh peerings. Table 8-182 provides the mesh peering protocol identifier values defined by this standard.

### Table 8-182—Mesh Peering Protocol Identifier field values

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Mesh peering management protocol</td>
</tr>
<tr>
<td>1</td>
<td>Authenticated mesh peering exchange protocol</td>
</tr>
<tr>
<td>2–254</td>
<td>Reserved</td>
</tr>
<tr>
<td>255</td>
<td>Vendor specific (The active mesh peering protocol is specified in a Vendor Specific element)</td>
</tr>
</tbody>
</table>
When the Mesh Peering Protocol Identifier field is 255, the active mesh peering protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

The Local Link ID field is the unsigned integer value generated by the local mesh STA to identify the mesh peering instance.

The conditional components of the Mesh Peering Management element are present depending on the Action field value of the frame in which the Mesh Peering Management element is conveyed.

The Peer Link ID field is the unsigned integer value generated by the peer mesh STA to identify the mesh peering instance. This field is not present for the Mesh Peering Open frame, is present for the Mesh Peering Confirm frame, and is optionally present for the Mesh Peering Close frame. The presence or absence of the Peer Link ID in a Mesh Peering Close is inferred by the Length field.

The Reason Code field enumerates reasons for sending a Mesh Peering Close. It is present for the Mesh Peering Close frame and is not present for Mesh Peering Open or Mesh Peering Confirm frames. The reason code is defined in 8.4.1.7.

The Chosen PMK field is present when dot11MeshSecurityActivated is true and a PMK is shared between the transmitter and receiver of the frame containing the element. It contains the PMKID that identifies the PMK used to protect the Mesh Peering Management frame.

Detailed usage of the Mesh Peering Management element is described in 13.3.6, 13.3.7, 13.3.8, and 13.5.5.

**8.4.2.105 Mesh Channel Switch Parameters element**

The Mesh Channel Switch Parameters element is used together with Channel Switch Announcement element and Extended Channel Switch Announcement element by a mesh STA in an MBSS to advertise to other mesh STAs when it is changing to a new operating channel and/or operating class. The format of the Mesh Channel Switch Parameters element is shown in Figure 8-371.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Time To Live</th>
<th>Flags</th>
<th>Reason Code</th>
<th>Precedence Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-371—Mesh Channel Switch Parameters element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The Time To Live field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.
The Flags field indicates the attribute of this channel switch attempt. The format of the Flags field is shown in Figure 8-372.

The Transmit Restrict subfield is set to 1 when the mesh STA asks neighboring peer mesh STAs not to transmit further frames except frames containing Mesh Channel Switch Parameters element on the current channel until the scheduled channel switch. The Transmit Restrict subfield is set to 0 otherwise.

The Initiator subfield is set to 1 when the mesh STA initiates this channel switch attempt. The Initiator subfield is set to 0 when this channel switch attempt is initiated by another mesh STA and propagated by the current mesh STA.

The Reason subfield indicates the validity of the Reason Code field. It is set to 1 if the Reason Code field is valid, and is set to 0 otherwise. When the Reason subfield is 0, the content of the Reason Code field is reserved.

The Reason Code field specifies the reason for the mesh channel switch. The Reason Code is defined in 8.4.1.7. The content of the Reason Code field is valid only when Reason subfield of Flags field is set to 1, and is reserved otherwise.

The Precedence Value field is coded as unsigned integer and is set to a random value in the range 0 to 65535 determined by the initiator of this channel switch attempt.

The Mesh Channel Switch Parameters element is included in Channel Switch Announcement frames, as described in 8.5.2.6, and Extended Channel Switch Announcement frames, as described in 8.5.8.7. During MBSS Channel Switch, the Mesh Channel Switch Parameters element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10, until scheduled channel switch.

8.4.2.106 Mesh Awake Window element

The Mesh Awake Window element is present in DTIM Beacon frames and is optionally present in Beacon and Probe Response frames. The format of the Mesh Awake Window element is shown in Figure 8-373.

\[ \begin{array}{cccc}
\text{Element ID} & \text{Length} & \text{Mesh Awake Window} \\
\hline
1 & 1 & 2 \\
\end{array} \]

**Figure 8-373—Mesh Awake Window element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2.

The Mesh Awake Window field is 2 octets long and contains an unsigned integer that indicates the duration of the mesh awake window in TUs.
8.4.2.107 Beacon Timing element

The Beacon Timing element is used to advertise the beacon timing information of neighbor STAs (mesh STAs, APs, or STAs in an IBSS). The format of the Beacon Timing element is shown in Figure 8-374.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Report Control</th>
<th>Beacon Timing Information #1</th>
<th>...</th>
<th>Beacon Timing Information #N</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>...</td>
</tr>
</tbody>
</table>

**Figure 8-374—Beacon Timing element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field indicates the number of octets in the Information field (fields following the Element ID and Length fields).

The Report Control field is used to signal information about the beacon timing information tuple contained in the Beacon Timing element. The structure of the Report Control field is defined in Figure 8-375.

<table>
<thead>
<tr>
<th>Status Number</th>
<th>Beacon Timing Element Number</th>
<th>More Beacon Timing Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits:</td>
<td>4</td>
<td>3</td>
</tr>
</tbody>
</table>

**Figure 8-375—Report Control field**

The Status Number subfield is set to the status number of the beacon timing information set. The status number is managed as described in 13.13.4.2.4.

The Beacon Timing Element Number subfield is an unsigned integer that indicates the index of the beacon timing information tuple contained in this Beacon Timing element. The Beacon Timing Element Number is set to 0 in the Beacon Timing element for the first or only tuple of the beacon timing information and is incremented by one for each successive tuple of the beacon timing information. The beacon timing information tuples are managed as described in 13.13.4.2.5.

The More Beacon Timing Element subfield is set to 1 if a successive tuple of beacon timing information exists, and set to 0 otherwise.

The Beacon Timing Information field contains the beacon timing information of a neighbor STA. When the mesh STA reports multiple beacon timing information, multiple Beacon Timing Information fields are included in the Beacon Timing element. The structure of the Beacon Timing Information field is defined in Figure 8-376.

<table>
<thead>
<tr>
<th>Neighbor STA ID</th>
<th>Neighbor TBT</th>
<th>Neighbor Beacon Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

**Figure 8-376—Beacon Timing Information field**

The Neighbor STA ID subfield is an unsigned integer that indicates the identification of the neighbor STA corresponding to this beacon timing information. When a mesh peering is established with this neighbor STA, the MSB of this field is set to 0, and the rest of this field is set to the last 7 digits (7 LSBs) of the AID.
value assigned to this neighbor mesh STA. When a mesh peering is not established with this neighbor STA, the MSB of this field is set to 1, and the rest of this field is set to the last 7 digits (7 LSBs, taking the I/G bit as the MSB) of the 48-bit MAC address of this neighbor STA.

NOTE—Since the Neighbor STA ID subfield is provided in abbreviated form, it is possible that the same Neighbor STA ID value appears in multiple Beacon Timing Information fields.

The Neighbor TBTT subfield is an unsigned integer that indicates a TBTT of the corresponding neighbor STA, measured in the local TSF timer of the mesh STA. The value is indicated in multiples of 32 µs. When the active synchronization method is the neighbor offset synchronization method, the TBTT is calculated as described in 13.13.4.2.2. The B5 to the B28 (taking the B0 as the LSB) of the calculated TBTT are contained in this subfield.

The Neighbor Beacon Interval subfield is an unsigned integer that indicates the beacon interval being used by the corresponding neighbor STA. The unit of the Neighbor Beacon Interval subfield is TU.

Detailed usage of the Beacon Timing element is described in 13.13.4.2.

8.4.2.108 MCCAOP Setup Request element

8.4.2.108.1 General

The MCCAOP Setup Request element is used to make an MCCAOP reservation. This element is transmitted in individually addressed MCCA Setup Request frames or in group addressed MCCA Setup Request frames. The mesh STA transmitting the MCCA Setup Request element is the MCCAOP owner of the MCCAOPs that will be scheduled with this reservation setup request. The receivers of the MCCAOP Setup Request are the MCCAOP responders. The format of the element is shown in Figure 8-377.

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation. It is determined by the MCCAOP owner. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127 and the MCCAOP Setup Request element is transmitted in an individually addressed frame to the intended responder. If this MCCAOP Setup Request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254 and the MCCAOP Setup Request element is transmitted in a group addressed frame. The value 255 is not used to identify a single MCCAOP reservation.

The MCCAOP Reservation field is described in 8.4.2.108.2.

8.4.2.108.2 MCCAOP Reservation field

The MCCAOP Reservation field is a 5 octet field specifying a schedule for frame transmissions called MCCAOPs. The MCCAOP Reservation field consists of three subfields and its format is shown in
The MCCAOP Duration subfield is 1 octet in length and contains an unsigned integer. It specifies the duration of the MCCAOPs in multiples of 32 µs.

The MCCAOP Periodicity subfield is 1 octet in length and contains a positive integer. It specifies the number of MCCAOPs scheduled in each DTIM interval.

The MCCAOP Offset subfield is three octets in length and contains an unsigned integer. It specifies the beginning of the first MCCAOP in each DTIM interval. The value is specified in multiples of 32 µs. The sum of MCCAOP Offset plus MCCAOP Duration is constrained to be smaller than the duration of the DTIM interval divided by MCCAOP Periodicity.

**8.4.2.109 MCCAOP Setup Reply element**

The MCCAOP Setup Reply element is used to reply to an MCCAOP Setup Request. This element is transmitted in individually addressed MCCA Setup Reply frames. The mesh STA transmitting the MCCA Setup Reply element is the MCCAOP responder of the MCCAOPs scheduled in this reservation setup. The receiver of the MCCAOP Setup Reply is the MCCAOP owner. The format of the element is shown in Figure 8-379.

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2 or 7 octets.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the requested series of MCCAOPs. It is determined by the MCCAOP owner and copied from the MCCAOP Setup Request element. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127. If this MCCAOP Setup Request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 to 254. The value 255 is not used to identify a single MCCAOP reservation.
The MCCA Reply Code field is a 1 octet field that contains the reply code used in an MCCAOP Setup Reply element. The reply codes are defined in Table 8-183.

### Table 8-183—MCCA Reply Code field values

<table>
<thead>
<tr>
<th>MCCA reply code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Accept</td>
</tr>
<tr>
<td>1</td>
<td>Reject: MCCAOP reservation conflict</td>
</tr>
<tr>
<td>2</td>
<td>Reject: MAF limit exceeded</td>
</tr>
<tr>
<td>3</td>
<td>Reject: MCCA track limit (dot11MCCAMaxTrackStates) exceeded</td>
</tr>
<tr>
<td>4–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The MCCAOP Reservation field includes an alternative to the MCCAOP reservation specified in the MCCAOP Setup Request message. Its format is described in 8.4.2.108.2. When the MCCA Reply Code is 1, the MCCAOP Reservation field might be present. When the MCCA Reply Code is set to other values, the MCCAOP Reservation field is not present.

### 8.4.2.110 MCCAOP Advertisement Overview element

The MCCAOP Advertisement Overview element is used by a mesh STA to advertise its MCCA Information and information about its MCCAOP Advertisement elements, representing its MCCAOP advertisement set, to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the MCCAOP Advertisement Overview element is shown in Figure 8-380.

<table>
<thead>
<tr>
<th>Octets</th>
<th>Length</th>
<th>Advertisement Set Sequence Number</th>
<th>Flags</th>
<th>MCCA Access Fraction</th>
<th>MAF Limit</th>
<th>Advertisement Elements Bitmap</th>
</tr>
</thead>
</table>

**Figure 8-380—MCCAOP Advertisement Overview element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement Overview element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.
The format of the Flags field is shown in Figure 8-381.

<table>
<thead>
<tr>
<th>Bits:</th>
<th>Accept Reservations</th>
<th>Reserved</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>7</td>
</tr>
</tbody>
</table>

![Figure 8-381—Flags field format](image)

The Flags field is set as follows:
- Bit 0: Accept Reservations subfield. The Accept Reservations subfield is set to 1 if the mesh STA accepts additional reservations. It is set to 0 otherwise.
- Bit 1–7: Reserved

The MCCA Access Fraction field is an eight bit unsigned integer. The MCCA Access Fraction field is set to the current value of the MCCA access fraction at the mesh STA rounded down (Floor) to the nearest multiple of (1/255) of the DTIM interval length.

The MAF Limit field is an eight bit unsigned integer. The MAF Limit field is set to the maximum MCCA access fraction allowed at the mesh STA rounded down (Floor) to the nearest multiple of (1/255) of the DTIM interval length.

The Advertisement Elements Bitmap field is 2 octets in length and indicates the MCCAOP Advertisement elements that are part of this MCCAOP advertisement set. The Advertisement Elements Bitmap field is a bitmap. Bit \( i \) in this bitmap equals 1 if the MCCAOP Advertisement element with MCCAOP Advertisement Element Index equal to \( i \) is part of this MCCAOP advertisement set, and it equals 0 otherwise.

### 8.4.2.111 MCCAOP Advertisement element

#### 8.4.2.111.1 General

The MCCAOP Advertisement element is used by a mesh STA to advertise MCCAOP reservations to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the element is shown in Figure 8-382.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Advertisement Set Sequence Number</th>
<th>MCCAOP Advertisement Element Information</th>
<th>TX-RX Periods Report</th>
<th>Broadcast Periods Report</th>
<th>Interference Periods Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>variable</td>
<td>variable</td>
<td>variable</td>
</tr>
</tbody>
</table>

![Figure 8-382—MCCAOP Advertisement element format](image)

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2 to 255 octets.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.
The MCCAOP Advertisement Element Information field is 1 octet in length. It is described in 8.4.2.111.2.

The TX-RX Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The TX-RX Periods Report field is described in 9.20.3.7.2.

The Broadcast Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The Broadcast Periods Report field is described in 9.20.3.7.2.

The Interference Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The Interference Periods Report field is described in 9.20.3.7.2.

8.4.2.111.2 MCCAOP Advertisement Element Information field

The MCCA Information field is 1 octet in length and provides information on the MCCAOP reservations. The field consists of four subfields and its format is shown in Figure 8-383.

```
B0  B3  B4  B5  B6  B7
MCCAOP Advertisement Element Index  TX-RX Report Present  Broadcast Report Present  Interference Report Present  Reserved
```

**Figure 8-383—MCCAOP Advertisement Element Information field**

The MCCAOP Advertisement Element Index subfield is a 4-bit unsigned integer. It identifies the MCCAOP Advertisement element.

The TX-RX Report Present subfield is 1 bit in length. It is set to 1 if the TX-RX Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no TX-RX Periods Report field is present.

The Broadcast Report Present subfield is 1 bit in length. It is set to 1 if the Broadcast Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Broadcast Periods Report field is present.

The Interference Report Present subfield is 1 bit in length. It is set to 1 if the Interference Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Interference Periods Report field is present.

8.4.2.111.3 MCCAOP Reservation Report field

The MCCAOP Reservation Report field is of variable length and is used to report a number of MCCAOP reservations. The field consists of a variable number of subfields and its format is shown in Figure 8-384.
The Number of Reported MCCAOP reservations is a field of 1 octet with an unsigned integer that specifies the number, n, of MCCAOP Reservations reported in this MCCAOP Reservation Report field.

The MCCAOP Reservation 1 through MCCAOP Reservation n fields specify the MCCAOP reservations reported. Each MCCAOP Reservation field is 5 octets in length and its format is shown in Figure 8-378 in 8.4.2.108.2.

### 8.4.2.112 MCCAOP Teardown element

The MCCAOP Teardown element is used to announce the teardown of an MCCAOP reservation. The MCCAOP Teardown element is transmitted in individually addressed MCCA Teardown frames or in group addressed MCCA Teardown frames. Its format is shown in Figure 8-385.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>MCCAOP Reservation ID</th>
<th>MCCAOP Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>0 or 6</td>
</tr>
</tbody>
</table>

**Figure 8-385—MCCAOP Teardown element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and set to 1 or 7 octets.

An MCCAOP Teardown element is transmitted by either the MCCAOP owner or the MCCAOP responder of a MCCAOP reservation to tear down the MCCAOP reservation.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation.

The MCCAOP Owner field is an optional field. It is 6 octets long and indicates the 48-bit MAC address of the MCCAOP owner. This field is only included if the element is transmitted by the MCCAOP responder.

### 8.4.2.113 GANN element

The GANN (gate announcement) element is used for announcing the presence of a mesh gate in the MBSS. The GANN element is transmitted in a Gate Announcement frame (see 8.5.17.4). The format of the GANN element is shown in Figure 8-386.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Flags</th>
<th>Hop Count</th>
<th>Element TTL</th>
<th>Mesh Gate Address</th>
<th>GANN Sequence Number</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>4</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-386—GANN element format**
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 15.

The Flags field is reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating mesh gate to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Mesh Gate Address field is represented as a 48-bit MAC address and is set to the MAC address of the mesh gate.

The GANN Sequence Number field is coded as an unsigned integer and is set to a GANN Sequence Number specific for the originating mesh gate.

The Interval field is coded as an unsigned integer and is set to the number of seconds between the periodic transmissions of Gate Announcements by the mesh gate.

Detailed usage of the GANN element is described in 13.11.2.

### 8.4.2.114 RANN element

The RANN (root announcement) element is used for announcing the presence of a mesh STA configured as root mesh STA with dot11MeshHWMProotMode set to rann (4). RANN elements are sent out periodically by such a root mesh STA. The RANN element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the RANN element is shown in Figure 8-387.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Flags</th>
<th>Hop Count</th>
<th>Element TTL</th>
<th>Root Mesh STA Address</th>
<th>HWMP Sequence Number</th>
<th>Interval</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

**Figure 8-387—RANN element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 21.

The format of the Flags field is shown in Figure 8-388.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Announcement</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-388—Flags field format**
The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Root Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1–7: Reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating root mesh STA to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Root Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the root mesh STA.

The HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP sequence number (SN) specific to the root mesh STA.

The Interval field is coded as an unsigned integer and is set to the number of TUs between the periodic transmissions of Root Announcements.

The Metric field is set to the cumulative metric from the originating root mesh STA to the mesh STA transmitting the announcement.

Detailed usage of the RANN element is described in 13.10.12.

**8.4.2.115 PREQ element**

The PREQ (path request) element is used for discovering a path to one or more target mesh STAs, maintaining a path (optional), building a proactive (reverse) path selection tree to the root mesh STA, and confirming a path to a target mesh STA (optional). The PREQ element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PREQ element is shown in Figure 8-389.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Flags</th>
<th>Hop Count</th>
<th>Element TTL</th>
<th>Path Discovery ID</th>
<th>Originator Mesh STA Address</th>
<th>Originator HWMP Sequence Number</th>
<th>Originator External Address</th>
<th>Lifetime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>4</td>
<td>6</td>
<td>4</td>
<td>0 or 6</td>
</tr>
</tbody>
</table>

**Figure 8-389—PREQ element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 37 to 252 octets.
The format of the Flags field is shown in Figure 8-390.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Gate Announcement</th>
<th>Addressing Mode</th>
<th>Proactive PREP</th>
<th>Reserved</th>
<th>AE</th>
<th>Reserved</th>
</tr>
</thead>
<tbody>
<tr>
<td>B0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>3</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-390—Flags field format**

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Originator Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1: Addressing Mode subfield (0 = group addressed, 1 = individually addressed). When the Addressing Mode subfield is 0, the PREQ element is sent in an HWMP Mesh Path Selection frame that is group addressed to all neighbor peer mesh STAs. When the Addressing Mode subfield is 1, the PREQ element is sent in an HWMP Mesh Path Selection frame that is individually addressed to a neighbor peer mesh STA. Detailed addressing information is provided in 13.10.7.
- Bit 2: Proactive PREP subfield (0 = off, 1 = on). The Proactive PREP subfield is only of relevance if the Target Address is the broadcast address (all ones). If equal to 1, every recipient of a PREQ with Target Address equal to the broadcast address replies with a PREP. If equal to 0, it will only reply under certain conditions (see 13.10.4.2).
- Bit 3–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Originator External Address is present, and that the originator mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the originator to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Path Discovery ID field is coded as an unsigned integer and is set to some unique ID for this PathDiscovery.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the originator MAC address.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN specific to the originator.

The Originator External Address field is the MAC address of an external STA proxied by the Originator. This field is only present if the AE subfield in the Flags field is set to 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREQ consider the forwarding information to be valid. The lifetime is measured in TUs.
The Metric field is set to the cumulative metric from the originator to the mesh STA transmitting the PREQ.

The Target Count N field is coded as an unsigned integer and gives the number of targets (N) contained in this PREQ. The maximum value of N is 20. The Per Target Flags field, the Target Address field, and the Target HWMP Sequence Number field are repeated N times in the element.

The format of the Per Target Flags field is shown in Figure 8-391.

<table>
<thead>
<tr>
<th>B0</th>
<th>B1</th>
<th>B2</th>
<th>B3</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>TO</td>
<td>Reserved</td>
<td>USN</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-391—Per Target Flags field format**

The Per Target Flags field is set as follows:
- Bit 0: TO (Target Only) subfield: The TO subfield defines which mesh STA responds with a PREP element to the PREQ element containing an individual target address. If TO = 1, only the target mesh STA responds with an individually addressed PREP. If TO = 0, intermediate mesh STAs with active forwarding information to the target mesh STA also respond.
- Bit 1: Reserved.
- Bit 2: USN (Unknown Target HWMP Sequence Number) subfield: The USN subfield indicates whether the Target HWMP Sequence Number field of the corresponding target is interpreted as HWMP SN (USN = 0) or not (USN = 1), the latter meaning that a target HWMP SN is unknown at the originator mesh STA.
- Bit 3–7: Reserved.

The Target Address field is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is the latest known HWMP SN received in the past by the originator mesh STA for any path towards the target. If such a target HWMP SN is not known, the USN subfield is set to 1 and Target HWMP Sequence Number field is reserved.

Detailed usage of the PREQ element is described in 13.10.9.

**8.4.2.116 PREP element**

The PREP (path reply) element is used to establish a forward path to a target and to confirm that a target is reachable. The PREP is issued in response to a PREQ. The PREP element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PREP element is shown in Figure 8-392.
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 31 or 37 octets.

The format of the Flags field is shown in Figure 8-393.

<table>
<thead>
<tr>
<th>B0</th>
<th>B5</th>
<th>B6</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved</td>
<td>AE</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

 Bits: 6 1 1

Figure 8-393—Flags field format

The Flags field is set as follows:

— Bit 0–5: Reserved.
— Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Target External Address is present, and that the target mesh STA is a proxy for this external address.
— Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the path target to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Target Mesh STA Address is the MAC address of the target mesh STA or target proxy mesh gate and is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the target mesh STA (if the AE subfield in the Flags field is set to 0) or target proxy mesh gate (if the AE subfield in the Flags field is set to 1).

The Target External Address field is set to the external address on behalf of which the PREP is sent. This field is present only if Bit 6 (AE subfield) in Flags field equals 1 and is represented as a 48-bit MAC address.
The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREP consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field indicates the cumulative metric from the path target to the mesh STA transmitting this element.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the originator, which is contained in the PREQ.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the originator mesh STA contained in the PREQ.

The detailed usage of the PREP element is described in 13.10.10.

8.4.2.117 PERR element

The PERR (path error) element is used for announcing an unreachable destination. The PERR element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PERR element is shown in Figure 8-394.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Element TTL</th>

<td>1</td>
<td>1</td>
<td>6</td>
<td>4</td>
<td>0 or 6</td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-394—PERR element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and set to \((2 + 13 \times \text{Number of Destinations})\) or to \((2 + 19 \times \text{Number of Destinations})\) octets.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Number of Destinations N field is coded as an unsigned integer and indicates the number of announced destinations in PERR. The maximum value of N is 19. The Flags field, the Destination Address field, the HWMP Sequence Number field, the Destination External Address field, and the Reason Code field are repeated N times in the element.

The format of the Flags field is shown in Figure 8-395.

<table>
<thead>
<tr>

<th>B6</th>
<th>B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved</td>
<td>AE</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-395—Flags field format**

The Flags field is set as follows:
- Bit 0–5: Reserved.
— Bit 6: AE (Address Extension) subfield (1 = destination external address is present, 0 = otherwise).
— Bit 7: Reserved.

The Destination Address field is represented as a 48-bit MAC address and indicates the detected unreachable destination MAC address.

The HWMP Sequence Number field is coded as an unsigned integer and indicates the HWMP SN for the invalidated destination, if applicable. Otherwise, the HWMP Sequence Number field is reserved depending on the reason code.

The Destination External Address field is set to the external address, on behalf of which the PERR is sent. This field is present only if Bit 6 (AE subfield) in the Flags field equals 1 and is represented as a 48-bit MAC address.

The Reason Code field specifies the reason for sending a PERR element. The Reason Code is defined in 8.4.1.7.

The detailed usage of the PERR element is described in 13.10.11.

### 8.4.2.118 PXU element

The PXU (proxy update) element is used to inform the destination mesh STA of the proxy information at the originator mesh STA. The PXU element is transmitted in a Proxy Update frame (see 8.5.18.2). The format of the PXU element is shown in Figure 8-396.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>PXU ID</th>
<th>PXU Originator MAC Address</th>
<th>Number of Proxy Information (N)</th>
<th>Proxy Information #1</th>

<td>11, 15, 17, or 21</td>
<td>11, 15, 17, or 21</td>
</tr>
</tbody>
</table>

**Figure 8-396—PXU element format**

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 8 + length of N Proxy Information fields.

The PXU ID field is coded as an unsigned integer and is set to the sequence number of the PXU. The source mesh STA sets the PXU ID field in the PXU element to a value from a single modulo-256 counter that is incremented by 1 for each new PXU element.

The PXU Originator MAC Address field is represented as a 48-bit MAC address and is the MAC address of the mesh STA that originates this PXU element.

The Number of Proxy Information fields is coded as an unsigned integer and is set to the number N of Proxy Information field that follow this field and that are reported to the destination mesh STA. The maximum value of N is 22.

The Proxy Information field contains a single proxy information (see 13.11.4.2). The length of the Proxy Information field depends on the settings of the subfields in the Flags subfield and is 11, 15, 17, or 21 octets.

The format of the Proxy Information field is defined in Figure 8-397.
The format of the Flags subfield is shown in Figure 8-398.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Bits: 1</td>
<td>1</td>
<td>1</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

Figure 8-398—Flags subfield

The Flags subfield is set as follows:

- Bit 0: The Delete subfield indicates whether this proxy information is to be deleted. It is set to 1 if the proxy information is to be deleted, and set to 0 otherwise.
- Bit 1: The Originator Is Proxy subfield indicates that the originator mesh STA of the PXU element is the proxy mesh gate of this proxy information when set to 1. In this case, there is no Proxy MAC Address subfield present in this Proxy Information field. When the Originator Is Proxy subfield is 0, the Proxy MAC Address subfield is present in this Proxy Information field.
- Bit 2: The Lifetime subfield indicates that the Proxy Information Lifetime subfield is present in this Proxy Information field when set to 1.
- Bit 3–7: Reserved.

The External MAC Address subfield is represented as a 48-bit MAC address and is the MAC address of the external STA proxied by the proxy mesh gate.

The Proxy Information Sequence Number field is coded as an unsigned integer and is set to the sequence number of the proxy information. The sequence number of the proxy information defines a chronological order of the proxy information for the external STA at this proxy mesh gate.

The Proxy MAC Address subfield is represented as a 48-bit MAC address and is set to the MAC address of the proxy mesh gate. It is only present if the Originator Is Proxy subfield of the Flags subfield is 0.

The Proxy Information Lifetime subfield is coded as an unsigned integer and is set to the time for which the mesh STA receiving this PXU considers this proxy information to be valid. The proxy information lifetime is measured in TUs. It is only present if the Lifetime subfield of the Flags subfield is 1.

8.4.2.119 PXUC element

The PXUC (proxy update confirmation) element is used to confirm the previously received PXU. The PXUC element is transmitted in a Proxy Update Confirmation frame (see 8.5.18.3). The format of PXUC element is shown in Figure 8-399.
The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 7.

The PXU ID field is coded as an unsigned integer and is the PXU ID of the received PXU that is being confirmed.

The PXU Recipient MAC Address is represented as a 48-bit MAC address and is set to the MAC address of the recipient of the PXU, i.e., the originator of the PXUC element.

### 8.4.2.120 Authenticated Mesh Peering Exchange element

The Authenticated Mesh Peering Exchange element includes information needed to perform the authentication sequence during an authenticated mesh peering exchange. This element is shown in Figure 8-400.

![Figure 8-400—Authenticated Mesh Peering Exchange element format](image)

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and indicates the number of octets in the information field (fields following the Element ID and Length fields).

The Selected Pairwise Cipher Suite field contains a pairwise cipher suite selector, as defined in 8.4.2.27.2, indicating a cipher suite to be used to secure the link.

The Local Nonce field contains a nonce value chosen by the mesh STA that is sending the element. It is encoded following the conventions from 8.2.2.

The Peer Nonce field contains a nonce value that was chosen by the peer mesh STA or candidate peer mesh STA to which the element is being sent. It is encoded following the conventions from 8.2.2.

The Key Replay Counter field is optional. It is only used for the Mesh Group Key Inform frame (see 13.6.3) and the Mesh Group Key Acknowledge frame (see 13.6.4). It is represented as an unsigned binary number.

The GTKdata field is optional. When present, it contains the bit string of \{GTK || Key RSC || GTKExpirationTime\} as the GTK data material. When present, the GTKdata field is protected by the exchange in which it is contained (see 13.5). The Key RSC denotes the last frame sequence number sent using the GTK and is specified in Table 11-5 of 11.6.2. GTKExpirationTime denotes the key lifetime of the GTK in seconds and the format is specified in Figure 11-36 of 11.6.2.
The IGTKdata field is present when dot11RSNAProtectedManagementFramesActivated equals true. When present, it contains the KeyID, IPN and IGTK used with BIP for management frame protection. The format of the IGTKdata field is specified in Figure 11-38 of 11.6.2.

Detailed usage of the Authenticated Mesh Peering Exchange element is described in 13.5.5 and in 13.6.

8.4.2.121 MIC element

The MIC element provides message integrity to Mesh Peering Management frames. The format of the MIC element is shown in Figure 8-401.

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>MIC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>16</td>
</tr>
</tbody>
</table>

Figure 8-401—MIC element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 16.

The MIC field contains a message integrity code calculated over the Mesh Peering Management frame (as specified in 13.5) and the mesh group key handshake frame (as specified in 13.6).

8.4.3 Information Subelements

Subelements are defined to have a common general format consisting of a 1-octet element-specific Subelement ID field, a 1-octet Length field, and a variable-length subelement-specific Data field. Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field. See Figure 8-402. Subelements are ordered by nondecreasing Subelement ID. See 9.24.9.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Length</th>
<th>Data</th>

<td>1</td>
</tr>
</tbody>
</table>

Figure 8-402—Subelement format
8.4.4 Access Network Query Protocol (ANQP) elements

8.4.4.1 General

ANQP-elements are defined to have a common format consisting of a 2-octet Info ID field (information identifier), a 2-octet Length field, and a variable-length element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The ANQP-element format is shown in Figure 8-403. See V.2 for informative text on ANQP usage.

![Figure 8-403—ANQP-element format](image)

Each ANQP-element in 8.4.4 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 8-184. The 2-octet Info ID field is encoded following the conventions given in 8.2.2.

<table>

<td>56798–65535</td>
<td>n/a</td>
</tr>
</tbody>
</table>
The Length field specifies the number of octets in the Information field and is encoded following the conventions given in 8.2.2.

The ANQP-elements that may be configured are shown in Table 8-184. If information is not configured for a particular ANQP-element, then a query for that element will return that element with all optional fields not present.

8.4.4.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying. Each ANQP-element may be returned in response to an Query List ANQP-element using the procedures in 10.24.3.2.2.

The format of the Query List ANQP-element is provided in Figure 8-404.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>ANQP Query ID #1</th>
<th>...</th>
<th>ANQP Query ID #N (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>0 or 2</td>
</tr>
</tbody>
</table>

**Figure 8-404—Query List ANQP-element format**

The Info ID field is a 2-octet field whose value is drawn from Table 8-184 corresponding to the Query List ANQP-element.

The Length field is a 2-octet field whose value is set to 2 times the number of ANQP Query ID fields.

Each ANQP Query ID field value is an Info ID drawn from Table 8-184. Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP query is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP query response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP query response is defined in 10.24.3.2.1.

8.4.4.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capability List ANQP-element.

The format of the Capability List ANQP-element is provided in Figure 8-405.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>ANQP Capability #1</th>
<th>...</th>
<th>ANQP Capability #N (optional)</th>
<th>Vendor Specific ANQP-element #1 (optional)</th>
<th>...</th>
<th>Vendor Specific ANQP-element #N (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>0 or 2</td>
<td>variable</td>
<td>...</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-405—Capability List ANQP-element format**

The Info ID field is a 2-octet field whose value is drawn from Table 8-184 corresponding to the Capability List ANQP-element.
The Length field is a 2-octet field whose value is set to 2 times the number of ANQP Capability fields following the Length field plus the sum of the lengths of the Vendor Specific ANQP-elements.

Each ANQP Capability field value is an Info ID drawn from Table 8-184. If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS Query Response. The list does not include any duplicate Info IDs, except possibly the Info ID for the Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-element is defined in 8.4.4.8. The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 8-184). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element element contains the capabilities of that vendor-specific query protocol.

### 8.4.4.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 8-406. The Venue Name ANQP-element may be used to provide additional metadata on the BSS. For example, the information may be used to assist a user in selecting the appropriate BSS with which to associate. Zero or more Venue Name fields may be included in the same or different languages.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Venue Info</th>
<th>Venue Name Duple #1 (optional)</th>
<th>...</th>
<th>Venue Name Duple #N (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
<td>variable</td>
<td>...</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-406—Venue Name ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the Venue Name ANQP-element.

The Length field is a 2-octet field whose value is set to two plus the total length of the Venue Name Duple fields.

The Venue Info field is a 2-octet field and is defined in 8.4.1.34.

The format of the Venue Name Duple field is shown in Figure 8-407.

<table>
<thead>
<tr>
<th>Length</th>
<th>Language Code</th>
<th>Venue Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

**Figure 8-407—Venue Name Duple field**

- The Length field is a 1-octet field whose value is equal to 3 plus the number of octets in the Venue Name field.
- The Language Code is a 3-octet ISO-14962-1997 [B45] encoded string field that defines the language used in the Venue Name field. The Language Code field is a two or three character language code selected from ISO-639 [B44]. A two character language code has 0 ("null" in ISO-14962-1997) appended to make it 3 octets in length.
8.4.4.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is provided in Figure 8-408.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Emergency Call Number Unit #1 (optional)</th>
<th>...</th>
<th>Emergency Call Number Unit #N (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>variable</td>
<td>...</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-408—Emergency Call Number ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency Call Number ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Emergency Call Number Unit fields.

Each Emergency Call Number Unit field has the structure shown in Figure 8-409.

<table>
<thead>
<tr>
<th>Length of Emergency Call Number</th>
<th>Emergency Call Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-409—Emergency Call Number Unit field format**

The Length of Emergency Call Number field is a 1-octet field whose value is set to the length of the Emergency Call Number field.

The Emergency Call Number field is a variable-length UTF-8 formatted field containing information, used to reach emergency services, from the network (e.g., dialed digits, emergency service URN label [B41]). UTF-8 format is defined in IETF RFC 3629.

8.4.4.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 8-410.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Network Authentication Type Unit #1 (optional)</th>
<th>...</th>
<th>Network Authentication Type Unit #N (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>variable</td>
<td>...</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-410—Network Authentication Type ANQP-element format**
The Info ID field is equal to the value in Table 8-184 corresponding to the Network Authentication Type ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Network Authentication Type Units fields.

Each Network Authentication Type Unit has the structure shown in Figure 8-411.

<table>
<thead>
<tr>
<th>Network Authentication Type Indicator</th>
<th>Redirect URL Length</th>
<th>Redirect URL (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-411—Network Authentication Type Unit field format**

The Network Authentication Type Indicator field is a 1-octet field and has one of the values shown in Table 8-185.

**Table 8-185—Network Authentication Type Indicator definitions**

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Acceptance of terms and conditions</td>
</tr>
<tr>
<td>1</td>
<td>On-line enrollment supported</td>
</tr>
<tr>
<td>2</td>
<td>http/https redirection</td>
</tr>
<tr>
<td>3</td>
<td>DNS redirection</td>
</tr>
<tr>
<td>4–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

Each Network Authentication Type Indicator defines additional information that may be communicated.

If the Network Authentication Type Indicator is 0, the network requires the user to accept terms and conditions. The Redirect URL can be used by the non-AP STA to obtain the terms and conditions. If the Redirect URL is not present, then, the Redirect URL Length is set to 0.

If the Network Authentication Type Indicator is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA may indicate to the user that accounts may be created. When the Network Authentication Type Indicator is 1, the Redirect URL Length is set to 0 and the Redirect URL is not present.

If the Network Authentication Type Indicator is 2, the network infrastructure performs http/https redirect. The ReDirect URL is used by the non-AP STA to perform additional steps required for network access.

If the Network Authentication Type Indicator is 3, the network supports DNS redirection. Higher layer software on the non-AP STA will exchange credentials with the network, the Redirect URL Length is set to 0 and the Redirect URL is not present.

The Redirect URL Length field is a 2-octet field whose value is the length of the Redirect URL. The value of the Redirect URL Length field is set to 0 whenever the Redirect URL is not present.
The Redirect URL field is a variable-length field that is optionally included if the Network Authentication Type Indicator is either 0 or 2. If the Network Authentication Type Indicator is other than 0 or 2, a Redirect URL is not included. The URL is formatted in accordance with IETF RFC 3986.

8.4.4.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list may be returned in response to a GAS Query using procedures in 10.24.3.2.3. The format of the Roaming Consortium ANQP-element is provided in Figure 8-412.

The Info ID field is equal to the value in Table 8-184 corresponding to the Roaming Consortium ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the OI Duple fields.

OIs contained within the Roaming Consortium element (see 8.4.2.98) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The format of the OI Duple field is provided in Figure 8-413.

— The value of the OI Length field is equal to the number of octets in the OI field.
— The OI field is defined in 8.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

8.4.4.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 8-414.

The Info ID field is equal to the value in Table 8-184 corresponding to the Vendor Specific ANQP-element.
The Length field is a 2-octet field whose value is set to the length of the OI field plus the length of the Vendor Specific Content field.

The OI field is defined in 8.4.1.31.

The Vendor Specific Content field is a variable-length field whose content is defined by the entity identified in the OI field.

### 8.4.4.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 8-415.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2</td>
<td>1</td>

</tbody>
</table>

#### 8.4.4.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is provided in Figure 8-417.

![Figure 8-417—NAI Realm ANQP-element format](image)

The Info ID field is equal to the value in Table 8-184 corresponding to the NAI Realm ANQP-element.

The Length field is a 2-octet field whose value is set to 2 plus the total length of the NAI Realm Data fields.

The NAI Realm Count field is a 2-octet field that specifies the number of NAI realms included in the NAI Realm ANQP-element.

The format of the NAI Realm Data field is shown in Figure 8-418.

![Figure 8-418—NAI Realm Data field format](image)
The NAI Realm Data Field Length is a 2-octet subfield whose value is equal to 3 plus the length of the NAI Realm subfield plus the sum of the lengths of the EAP Method subfields.

The NAI Realm Encoding is a 1-octet subfield whose format is shown in Figure 8-419.

```
<table>
<thead>
<tr>
<th>Bits:</th>
<th>B0</th>
<th>B1B7</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAI Realm Encoding Type</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>
```

**Figure 8-419—NAI Realm Encoding subfield format**

The NAI Realm Encoding Type is a 1-bit subfield. It is set to 0 to indicate that the NAI Realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate it is a UTF-8 formatted character string that is not formatted in accordance with IETF RFC 4282.

**NOTE—** This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI Realm formats.

NAI Realm Length subfield is a 1-octet subfield whose value is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI Realms formatted as defined in the NAI Realm Encoding Type bit of the NAI Realm Encoding subfield. If there is more than one NAI Realm in this subfield, the NAI Realms are delimited by a semi-colon character (i.e., “;”, which is encoded in UTF-8 format as 0x3B). All the realms included in the NAI Realm subfield support all the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The format of the optional EAP Method subfield is shown in Figure 8-420. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP method.

```
<table>
<thead>
<tr>
<th>Octets:</th>
<th>1</th>
<th>1</th>
<th>1</th>
<th>variable</th>
<th>variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>EAP Method</td>
<td>Authentication Parameter Count</td>
<td>Authentication Parameter #1 (optional)</td>
<td>...</td>
<td>Authentication Parameter #N (optional)</td>
</tr>
</tbody>
</table>
```

**Figure 8-420—EAP Method subfield format**

The Length subfield is a 1-octet subfield whose value is equal to 2 plus the length of the Authentication Parameter subfields.

The EAP method subfield is a 1-octet subfield that is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.
The format of the Authentication Parameter subfield is shown in Figure 8-421.

<table>
<thead>
<tr>
<th>ID</th>
<th>Length</th>
<th>Authentication Parameter Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-421—Authentication Parameter subfield format**

The ID subfield is a 1-octet subfield that indicates the type of authentication information provided.

The Length subfield is a 1-octet subfield whose value is set to the length of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable-length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 8-188. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all the required authentication parameter requirements to be provided.

**Table 8-188—Authentication Parameter types**

<table>

</tbody>
</table>

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 8-189 describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian byte order.
The Non-EAP Inner Authentication Type is specified as single enumerated value given in Table 8-188. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334), CHAP (as specified in IETF RFC 1994), MSCHAP (as specified in IETF RFC 2433), and MSCHAPv2 (as specified in IETF RFC 2759).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 8-188. If the value is equal to the “Vendor Specific” value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 8-190.

### 8.4.4.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a 3GPP non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 8-422.
The Info ID field is equal to the value in Table 8-184 corresponding to the 3GPP Cellular Network ANQP-element.  

The Length field is a 2-octet field whose value is set to the length of the Payload field.  

The Payload field is a variable-length field and is a generic container. An example of the format and content is defined in Annex A of 3GPP TS 24.234.

### 8.4.4.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP’s location in LCI format; see 8.4.2.24.10.  

The format of the AP Geospatial Location ANQP-element is provided in Figure 8-423.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Location Configuration Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-423—AP Geospatial Location ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Geospatial Location ANQP-element.  

The Length field is a 2-octet field whose value is set to 18.  

The Location Configuration Report is an 18-octet field and the format is provided in 8.4.2.24.10. There are no Optional Subelements field present in the Location Configuration Report when it is used in the AP Geospatial Location ANQP-element. This information is taken from the dot11APLCITable MIB object.

### 8.4.4.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP’s location in Civic format. The format of the AP Civic Location ANQP-element is provided in Figure 8-424.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Location Civic Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-424—AP Civic Location ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Civic Location ANQP-element.  

The Length field is a 2-octet field whose value is set to the length of the Location Civic Report.  

The Location Civic Report is a variable-length field and the format is provided in 8.4.2.24.13. This information is taken from the dot11ApCivicLocation MIB object.

### 8.4.4.14 AP Location Public Identifier URI ANQP-element

The AP Location Public Identifier URI ANQP-element provides an indirect reference to the location information for the AP. This list element may be returned in response to a GAS Query using the
The format of the AP Location Public Identifier URI ANQP-element is provided in Figure 8-425.

![Figure 8-425—AP Location Public Identifier URI ANQP-element format](image)

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Location Public Identifier URI.

The Length field is a 2-octet field whose value is set to the length of the AP Location Public Identifier URI field.

The Public Identifier URI field is a variable-length field and is defined in 8.4.2.24.13.

8.4.4.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is provided in Figure 8-426.

![Figure 8-426—Domain Name ANQP-element format](image)

The Info ID field is equal to the value in Table 8-184 corresponding to the Domain Name ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Domain Name Fields.

The format of the Domain Name subfield is shown in Figure 8-427.

![Figure 8-427—Domain Name subfield format](image)

The Length subfield is a 1-octet subfield whose value is set to the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the “Preferred Name Syntax” as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

8.4.4.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.
The format of the Emergency Alert URI ANQP-element is provided in Figure 8-428.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Emergency Alert URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 2</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-428—Emergency Alert URI ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency Alert URI ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Emergency Alert Identifier URI field.

The Emergency Alert URI field is a variable-length field used to indicate the URI at which an EAS message may be retrieved as described in 10.24.7. The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

### 8.4.4.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string, which is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is provided in Figure 8-429.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Emergency NAI Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 2</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-429—Emergency NAI ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency NAI ANQP-element.

The Length field is a 2-octet field whose value is set to the length of Emergency NAI Information field.

The Emergency NAI Information field is a variable-length UTF-8 field formatted in accordance with IETF RFC 4282. UTF-8 format is defined in IETF RFC 3629.

### 8.4.4.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability is provided in Figure 8-430.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Peer Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 2</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-430—TDLS Capability ANQP-element format**

The Info ID field is equal to the value in Table 8-184 corresponding to the TDLS Capability ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Peer Information field.
The Peer Information field is a variable-length field containing information that a STA can use to establish a TDLS link and is defined as an XML schema (see V.6). An example of the peer information is described in 10.24.3.2.10.

**8.4.4.19 Neighbor Report ANQP-element**

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state.

<table>
<thead>
<tr>
<th>Info ID</th>
<th>Length</th>
<th>Neighbor Report element (optional)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2</td>
<td>variable</td>
</tr>
</tbody>
</table>

*Figure 8-431—Neighbor Report ANQP-element format*

The Info ID field is equal to the value in Table 8-184 corresponding to the Neighbor Report ANQP-element.

The Length field is a 2-octet field whose value is set to the number of octets in the Neighbor Report field.

The format of the Neighbor Report element is shown in Figure 8-215 defined in 8.4.2.39. The Element ID and the Length fields of the Neighbor Report element, as shown in Figure 8-215, are not included.

**8.5 Action frame format details**

**8.5.1 Introduction**

Subclause 8.5 describes the Action field formats allowed in each of the action categories defined in Table 8-38 in 8.4.1.11.

**8.5.2 Spectrum management Action frames**

**8.5.2.1 General**

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the octet field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 8-191.

*Table 8-191—Spectrum Management Action field values*

<table>
<thead>
<tr>
<th>Spectrum Management Action field value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Measurement Request</td>
</tr>
<tr>
<td>1</td>
<td>Measurement Report</td>
</tr>
<tr>
<td>2</td>
<td>TPC Request</td>
</tr>
<tr>
<td>3</td>
<td>TPC Report</td>
</tr>
<tr>
<td>4</td>
<td>Channel Switch Announcement</td>
</tr>
<tr>
<td>5–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
8.5.2.2 Measurement Request frame format

The Measurement Request frame uses the Action frame body format and is transmitted by a STA requesting another STA to measure one or more channels. The format of the Measurement Request Action field is shown in Figure 8-432.

<table>
<thead>
<tr>
<th>Category</th>
<th>Spectrum Management Action</th>
<th>Dialog Token</th>
<th>Measurement Request Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-432—Measurement Request frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 0 (representing a Measurement Request frame).

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 8.4.2.23. The number and length of the Measurement Request elements in a Measurement Request frame is limited by the maximum allowed MMPDU size.

8.5.2.3 Measurement Report frame format

The Measurement Report frame uses the Action frame body format and is transmitted by a STA in response to a Measurement Request frame or by a STA autonomously providing measurement information. The format of the Measurement Report Action field is shown in Figure 8-433.

<table>
<thead>
<tr>
<th>Category</th>
<th>Spectrum Management Action</th>
<th>Dialog Token</th>
<th>Measurement Report Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-433—Measurement Report frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 1 (representing a Measurement Report frame).

The Dialog Token field is set to the value in any corresponding Measurement Request frame. If the Measurement Report frame is not being transmitted in response to a Measurement Request frame, then the Dialog token is set to 0.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 8.4.2.24. The number and length of the Measurement Report elements in a Measurement Report frame is limited by the maximum allowed MMPDU size.
8.5.2.4 TPC Request frame format

The TPC Request frame uses the Action frame body format and is transmitted by a STA requesting another STA for transmit power and link margin information. The format of the TPC Request Action field is shown in Figure 8-434.

<table>
<thead>
<tr>
<th>Category</th>
<th>Spectrum Management Action</th>
<th>Dialog Token</th>
<th>TPC Request element</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

Figure 8-434—TPC Request frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 2 (representing a TPC Request frame).

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The TPC Request element is set as described in 8.4.2.18.

8.5.2.5 TPC Report frame format

The TPC Report frame uses the Action frame body format and is transmitted by a STA in response to a TPC Request frame. The format of the TPC Report Action field is shown in Figure 8-435.

<table>
<thead>
<tr>
<th>Category</th>
<th>Spectrum Management Action</th>
<th>Dialog Token</th>
<th>TPC Report element</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>

Figure 8-435—TPC Report frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 3 (representing a TPC Report frame).

The Dialog Token field is set to the Dialog Token value in the corresponding TPC Request frame.

The TPC Report element is set as described 8.4.2.19.

8.5.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame uses the Action frame body format and is transmitted by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise a channel switch. The format of the Channel Switch Announcement Action field is shown in Figure 8-436.
The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 4 (representing a Channel Switch Announcement frame).

The Channel Switch Announcement element is set as described 8.4.2.21.

The Secondary Channel Offset element is defined in 8.4.2.22. This element is present when switching to a 40 MHz channel. It may be present when switching to a 20 MHz channel (in which case the secondary channel offset is set to SCN).

The Mesh Channel Switch Parameters element is defined in 8.4.2.105. This element is present when a mesh STA performs MBSS channel switch. The Mesh Channel Switch Parameters element is not included for channel switch other than MBSS.

8.5.3 QoS Action frame details

8.5.3.1 General

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 8-192.

<table>
<thead>
<tr>
<th>QoS Action field value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ADDTS Request</td>
</tr>
<tr>
<td>1</td>
<td>ADDTS Response</td>
</tr>
<tr>
<td>2</td>
<td>DELTS</td>
</tr>
<tr>
<td>3</td>
<td>Schedule</td>
</tr>
<tr>
<td>4</td>
<td>QoS Map Configure</td>
</tr>
<tr>
<td>5–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

8.5.3.2 ADDTS Request frame format

The ADDTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 10.4.

The Action field of the ADDTS Request frame contains the information shown in Table 8-193.
Table 8-193—ADDTS Request frame Action field format

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>QoS Action</td>
</tr>
<tr>
<td>3</td>
<td>Dialog Token</td>
</tr>
<tr>
<td>4</td>
<td>TSPEC</td>
</tr>
<tr>
<td>5–n</td>
<td>TCLAS (optional)</td>
</tr>
<tr>
<td>n + 1</td>
<td>TCLAS Processing (optional)</td>
</tr>
<tr>
<td>n + 2</td>
<td>U-APSD Coexistence (optional)</td>
</tr>
<tr>
<td>n + 3</td>
<td>Expedited Bandwidth Request element (optional)</td>
</tr>
</tbody>
</table>

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 0 (representing ADDTS request).

The Dialog Token, TCLAS, and TCLAS Processing fields of this frame are contained in an MLME-ADDTS.request primitive that causes the frame to be sent. Some of the TSPEC parameters are contained in the MLME-ADDTS.request primitive while the other parameters (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 8.4.2.32, and the optional TCLAS element, defined in 8.4.2.33, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA or HCCA). There may be one or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there are more than one TCLAS element and is defined in 8.4.2.35. There may be one Expedited Bandwidth Request element, which is defined in 8.4.2.96.

The U-APSD Coexistence element, defined in 8.4.2.93, contains the coexistence parameters requested by the non-AP STA when using the U-APSD Coexistence capability as described in 10.2.1.5.2. The U-APSD Coexistence element is optionally present.

8.5.3.3 ADDTS Response frame format

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 8-194.

Table 8-194—ADDTS Response frame Action field format

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>QoS Action</td>
</tr>
<tr>
<td>3</td>
<td>Dialog Token</td>
</tr>
</tbody>
</table>
Table 8-194—ADDTS Response frame Action field format (continued)

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Status Code</td>
</tr>
<tr>
<td>5</td>
<td>TS Delay</td>
</tr>
<tr>
<td>6</td>
<td>TSPEC</td>
</tr>
<tr>
<td>7–n</td>
<td>TCLAS (optional)</td>
</tr>
<tr>
<td>n + 1</td>
<td>TCLAS Processing (optional)</td>
</tr>
<tr>
<td>n + 2</td>
<td>Schedule</td>
</tr>
<tr>
<td>n + 3</td>
<td>Expedited Bandwidth Request (optional)</td>
</tr>
</tbody>
</table>

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 1 (representing ADDTS response).

The Status Code field is defined in 8.4.1.9.

The Dialog Token, TS Delay, TSPEC, TCLAS, TCLAS Processing, and Expedited Bandwidth Request fields in this frame are contained in an MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to 47.

The Schedule element, defined in 8.4.2.36, is present in an ADDTS Response frame only if the status code is equal to 0 (i.e., when the TS is admitted).

### 8.5.3.4 DELTS frame format

The DELTS frame is used to delete a TS using the procedures defined in 10.4.9.

The Action field of a DELTS frame contains the information shown in Table 8-195.

Table 8-195—DELTS frame Action field format

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>QoS Action</td>
</tr>
<tr>
<td>3</td>
<td>TS Info</td>
</tr>
<tr>
<td>4</td>
<td>Reason Code</td>
</tr>
</tbody>
</table>

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 2 (representing DELTS).

The TS Info field is defined in 8.4.2.32.

The Reason Code field is defined in 8.4.1.7.
A DELTS frame is used to delete a TS characterized by the TS Info field in the frame. A DELTS frame may be sent from the HC to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

### 8.5.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 8-196.

#### Table 8-196—Schedule frame Action field format

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>QoS Action</td>
</tr>
<tr>
<td>3</td>
<td>Schedule</td>
</tr>
</tbody>
</table>

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 3 (representing Schedule).

The Schedule element is defined in 8.4.2.36.

### 8.5.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map Set to a non-AP STA using the procedures defined in 10.24.9.

The frame body of the QoS Map Configure frame contains the information shown in Table 8-197.

#### Table 8-197—QoS Map configure frame body

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Category</td>
</tr>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>
<td>2</td>
<td>QoS Map Set</td>
</tr>
</tbody>
</table>

The Category field is set to the value in Table 8-38.

The Action field is set to the value in Table 8-192.

The QoS Map Set element is defined in 8.4.2.97.
8.5.4 DLS Action frame details

8.5.4.1 General

Several Action frame formats are defined for DLS management purposes. A DLS Action field, in the octet field immediately after the Category field, differentiates the formats. The DLS Action field values associated with each frame format are defined in Table 8-198.

<table>
<thead>
<tr>
<th>DLS Action field value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>DLS Request</td>
</tr>
<tr>
<td>1</td>
<td>DLS Response</td>
</tr>
<tr>
<td>2</td>
<td>DLS Teardown</td>
</tr>
<tr>
<td>3–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

8.5.4.2 DLS Request frame format

The DLS Request frame is used to set up a direct link with a peer MAC. The Action field of the DLS Request frame contains the information shown in Table 8-199, with some fields being optionally present as indicated in the “Notes” column of the table.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>DLS Action</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Destination MACAddress</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Source MACAddress</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Capability Information</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>DLS Timeout Value</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Supported rates</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Extended Supported Rates</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>HT Capabilities</td>
<td>The HT Capabilities element is present when the dot11HighThroughputOptionImplemented attribute is true.</td>
</tr>
</tbody>
</table>
The Source MAC Address field value is the MAC address of the initiating STA.

The Capability Information field value is the capability information of the originator of the request.

The DLS Timeout Value field is defined in 8.4.1.13.

The Supported Rates and Extended Supported Rates fields contain the supported rates information of the originator.

### 8.5.4.3 DLS Response frame format

The DLS Response frame is sent in response to a DLS Request frame. The Action field of a DLS Response frame contains the information shown in Table 8-200, with some fields being optionally present as indicated in the “Notes” column of the table.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>DLS Action</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Status Code</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Destination MACAddress</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Source MACAddress</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Capability Information</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Supported rates</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Extended Supported rates</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>HT Capabilities</td>
<td>The HT Capabilities element is present when the dot11HighThroughputOptionImplemented attribute is true.</td>
</tr>
</tbody>
</table>

The Category field is set to 2 (representing DLS).

The DLS Action field is set to 1 (representing DLS response).

The Status Code field is defined in 8.4.1.9.

The Destination MAC Address field value and the Source MAC Address field value are copied from the corresponding fields in the DLS Request frame.

The Capability Information field is the capability information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).

The Supported Rates and Extended Supported Rates fields contain the supported rates information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).
8.5.4.4 DLS Teardown frame format

The DLS Teardown frame is sent to terminate a direct link with a peer MAC. The Action field of the DLS Teardown frame contains the information shown in Table 8-201.

Table 8-201—DLS Teardown frame Action field format

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>DLS Action</td>
</tr>
<tr>
<td>3</td>
<td>Destination MAC Address</td>
</tr>
<tr>
<td>4</td>
<td>Source MAC Address</td>
</tr>
<tr>
<td>5</td>
<td>Reason Code</td>
</tr>
</tbody>
</table>

The Category field is set to 2 (representing DLS).

The DLS Action field is set to 2 (representing DLS teardown).

The Destination MAC Address field value is the MAC address of the target destination.

The Source MAC Address field value is the MAC address of the initiating STA.

The Reason Code field is defined in 8.4.1.7.

8.5.5 Block Ack Action frame details

8.5.5.1 General

The ADDBA frames are used to set up or, if PBAC is used, to modify Block Ack for a specific TC or TS. A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 8-202.

Table 8-202—Block Ack Action field values

<table>
<thead>
<tr>
<th>Block Ack Action field values</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ADDBA Request</td>
</tr>
<tr>
<td>1</td>
<td>ADDBA Response</td>
</tr>
<tr>
<td>2</td>
<td>DELBA</td>
</tr>
<tr>
<td>3–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
8.5.5.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of Block Ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 8-203.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>Block Ack Action</td>
</tr>
<tr>
<td>3</td>
<td>Dialog Token</td>
</tr>
<tr>
<td>4</td>
<td>Block Ack Parameter Set</td>
</tr>
<tr>
<td>5</td>
<td>Block Ack Timeout Value</td>
</tr>
<tr>
<td>6</td>
<td>Block Ack Starting Sequence Control</td>
</tr>
</tbody>
</table>

The Category field is set to 3 (representing Block Ack).

The Block Ack Action field is set to 0 (representing ADDBA request).

The Dialog Token field is set to a nonzero value chosen by the STA.

The Block Ack Parameter Set field is defined in 8.4.1.14.

The Block Ack Timeout Value field is defined in 8.4.1.15.

The Block Ack Starting Sequence Control field is defined in 8.3.1.8.

8.5.5.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 8-204.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>Block Ack Action</td>
</tr>
<tr>
<td>3</td>
<td>Dialog Token</td>
</tr>
<tr>
<td>4</td>
<td>Status Code</td>
</tr>
<tr>
<td>5</td>
<td>Block Ack Parameter Set</td>
</tr>
<tr>
<td>6</td>
<td>Block Ack Timeout Value</td>
</tr>
</tbody>
</table>
The Category field is set to 3 (representing Block Ack).

The Block Ack Action field is set to 1 (representing ADDBA response).

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 8.4.1.9.

The Block Ack Parameter Set field is defined in 8.4.1.14.

The Block Ack Timeout Value field is defined in 8.4.1.15.

**8.5.5.4 DELBA frame format**

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the Block Ack participation. The Action field of a DELBA frame format contains the information shown in Table 8-205.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
</tr>
<tr>
<td>2</td>
<td>Block Ack Action</td>
</tr>
<tr>
<td>3</td>
<td>DELBA Parameter Set</td>
</tr>
<tr>
<td>4</td>
<td>Reason Code</td>
</tr>
</tbody>
</table>

The Category field is set to 3 (representing DELBA).

The Block Ack Action field is set to 2 (representing DELBA).

The DELBA Parameters field is defined in 8.4.1.16.

The Reason Code field is defined in 8.4.1.17.

**8.5.6 Vendor-specific action details**

The Vendor Specific Action frame is defined for vendor-specific signaling. The format of the Action field of the Vendor Specific Action frame is shown in Figure 8-437. An Organization Identifier, in the octet field immediately after the Category field, differentiates the vendors (see 8.4.1.31).

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 8-38) are protected; otherwise they are unprotected.

<table>
<thead>
<tr>
<th>Category</th>
<th>Organization Identifier</th>
<th>Vendor Specific Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>j</td>
</tr>
</tbody>
</table>

**Figure 8-437—Vendor Specific Action frame Action field format**

The Category field is set to the value indicating the vendor-specific category, as specified in Table 8-38.
The Organization Identifier contains a public organizationally unique identifier assigned by the IEEE and is specified in 8.4.1.31. The order of the Organization Identifier field is described in 8.2.2.

TheVendor Specific Content contains vendor-specific field(s). The length of the Vendor Specific Content in a Vendor Specific Action frame is limited by the maximum allowed MMPDU size.

**8.5.7 Radio Measurement action details**

**8.5.7.1 General**

Several Action frame formats are defined for Radio Measurement purposes. A Radio Measurement Action field, in the octet field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 8-206.

<table>
<thead>
<tr>
<th>Radio Measurement Action field value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Radio Measurement Request</td>
</tr>
<tr>
<td>1</td>
<td>Radio Measurement Report</td>
</tr>
<tr>

<td>Link Measurement Report</td>
</tr>
<tr>
<td>4</td>
<td>Neighbor Report Request</td>
</tr>
<tr>
<td>5</td>
<td>Neighbor Report Response</td>
</tr>
<tr>
<td>6–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**8.5.7.2 Radio Measurement Request frame format**

The Radio Measurement Request frame uses the Action frame body format. It is transmitted by a STA requesting another STA to make one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 8-438.

<table>
<thead>
<tr>
<th>Category</th>
<th>Radio Measurement Action</th>
<th>Dialog Token</th>
<th>Number of Repetitions</th>
<th>Measurement Request Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

**Figure 8-438—Radio Measurement Request frame Action field format**

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a Measurement Request according to Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.
The Number of Repetitions field contains the requested number of repetitions for all the Measurement Request elements in this frame. A value of 0 in the Number of Repetitions field indicates Measurement Request elements are executed once without repetition. A value of 65 535 in the Number of Repetitions field indicates Measurement Request elements are repeated until the measurement is cancelled or superseded.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 8.4.2.23. The number and length of the Measurement Request elements in a Measurement Request frame is limited by the maximum allowed MMPDU size.

### 8.5.7.3 Radio Measurement Report frame format

The Radio Measurement Report frame uses the Action frame body format. It is transmitted by a STA in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 8-439.

<table>
<thead>
<tr>
<th>Category</th>
<th>Radio Measurement Action</th>
<th>Dialog Token</th>
<th>Measurement Report Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-439—Radio Measurement Report frame Action field format**

The Category field is set to indicate the Radio Measurement category according to Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a radio measurement report according to Table 8-206 in 8.5.7.

The Dialog Token field is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the Dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 8.4.2.24. The number and length of the Measurement Report elements in a single Radio Measurement Report frame is limited by the maximum allowed MMPDU size. Subclause 10.11.6 describes the required behavior for multiframe Radio Measurement Report frame responses.

### 8.5.7.4 Link Measurement Request frame format

The Link Measurement Request frame uses the Action frame body format and is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. The format of the Action field in the Link Measurement Request frame is shown in Figure 8-440.

<table>
<thead>
<tr>
<th>Category</th>
<th>Radio Measurement Action</th>
<th>Dialog Token</th>
<th>Transmit Power Used</th>
<th>Max Transmit Power</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>Octets: 1</td>
<td>Octets: variable</td>
</tr>
</tbody>
</table>

**Figure 8-440—Link Measurement Request frame Action field format**

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.
The Radio Measurement Action field is set to indicate a Link Measurement Request according to Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 8.4.1.20.

The Max Transmit Power field provides the upper limit on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 8.4.1.19. The Max Transmit Power field is a twos complement signed integer and is 1 octet in length, providing an upper limit, in a dBm scale, on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. The maximum tolerance for the value reported in Max Transmit Power field is ±5 dB. The value of the Max Transmit Power field is equal to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-207. A Yes in the Extensible column of a subelement listed in Table 8-207 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

**Table 8-207—Optional subelement IDs for Link Measurement Request frame**

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>1 to 255</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

**8.5.7.5 Link Measurement Report frame format**

The Link Measurement Report frame uses the Action frame body format and is transmitted by a STA in response to a Link Measurement Request frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 8-441.
The Category field is set to indicate the Radio Measurement category according to Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a Link Measurement Report according to Table 8-206 in 8.5.7.

The Dialog Token field is set to the Dialog Token value in the corresponding Link Measurement Request frame.

The TPC Report element is set as described in 8.4.2.19.

The Receive Antenna ID field contains the identifying number for the antenna(s) used to receive the corresponding Link Measurement Request frame. Antenna ID is defined in 8.4.2.42.

The Transmit Antenna ID field contains the identifying number for the antenna(s) used to transmit this Link Measurement Report frame. Antenna ID is defined in 8.4.2.42.

RCPI indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the indicated PHY Type, as described in 8.4.2.40.

RSNI indicates the received signal to noise indication for the corresponding Link Measurement Request frame, as described in 8.4.2.43.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-208. A Yes in the Extensible column of a subelement listed in Table 8-208 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–220</td>
<td>Reserved</td>
<td></td>

<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

### 8.5.7.6 Neighbor Report Request frame format

The Neighbor Report Request frame uses the Action frame body format and is transmitted by a STA requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 8-442.

<table>
<thead>
<tr>
<th>Category</th>
<th>Radio Measurement Action</th>
<th>Dialog Token</th>
<th>Optional Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

**Figure 8-442—Neighbor Report Request frame Action field format**

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to the value indicating Neighbor Report Request, as specified in Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Optional Subelements field format contains zero or more subelements each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-209. A Yes in the Extensible column of a subelement listed in Table 8-209 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

**Table 8-209—Optional subelement IDs for Neighbor Report Request frame**

<table>
<thead>
<tr>
<th>Subelement ID</th>
<th>Name</th>
<th>Length field (octets)</th>
<th>Extensible</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SSID</td>
<td>0 to 32</td>
<td></td>
</tr>
<tr>
<td>1–220</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
<tr>
<td>221</td>
<td>Vendor Specific</td>
<td>1 to 255</td>
<td></td>
</tr>
<tr>
<td>222–255</td>
<td>Reserved</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The SSID and Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.2 and 8.4.2.28, respectively). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.
The presence of an optional SSID subelement in a Neighbor Report Request frame indicates a request for a neighbor list for the specified SSID in the SSID Element. The absence of an SSID element indicates neighbor report for the current ESS.

8.5.7.7 Neighbor Report Response frame format

The Neighbor Report Response frame uses the Action frame body format and is transmitted by a STA in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 8-443.

<table>
<thead>
<tr>
<th>Category</th>
<th>Radio Measurement Action</th>
<th>Dialog Token</th>
<th>Neighbor Report Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>variable</td>
</tr>
</tbody>
</table>

Figure 8-443—Neighbor Report Response frame Action field format

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to the value indicating Neighbor Report Response, as specified in Table 8-206 in 8.5.7.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the Dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 8.4.2.39. If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report Elements in a Neighbor Report frame is limited by the maximum allowed MMPDU size.

8.5.8 Public Action details

8.5.8.1 Public Action frames

The Public Action frame is defined to allow the following:
- Inter-BSS and AP to unassociated-STA communications
- Intra-BSS communication
- GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 8-210.

<table>
<thead>
<tr>
<th>Public Action field value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>TDLS Discovery Response</td>
</tr>
<tr>
<td>15</td>
<td>Location Track Notification</td>
</tr>
<tr>
<td>16–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

8.5.8.3 Measurement Pilot frame format

The Measurement Pilot frame uses the Action frame format. The format of the Action field is shown in Figure 8-444.
The Category field is set to the value indicating the Public category, as specified in Table 8-38 in 8.4.1.11.

The Public Action field is set to the value indicating Measurement Pilot, as specified in Table 8-210 in 8.5.8.1.

The Condensed Capability Information field contains two subfields as shown in Figure 8-445.

The Spectrum Management subfield is set to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 if dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the Short Slot Time subfield is set to 0.

The Condensed Country String field is set to the first two octets of the value contained in dot11CountryString.

Operating Class indicates the operating class value for the operating channel. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for the operating channel. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the operating channel. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Pilot Interval field is set to the value contained in dot11RMMeasurementPilotPeriod.

The Optional Subelements field format contains zero or more subelements each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-212. A Yes in the Extensible column of a subelement listed in Table 8-212 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.
The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 8.4.2.48 and 8.4.2.38, respectively). Multiple Vendor Specific subelements may be included in the list of optional subelements.

### 8.5.8.4 DSE Enablement frame format

The DSE Enablement frame is an Action frame. It is transmitted by a STA as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 8-446.

<table>
<thead>
<tr>
<th>Category</th>
<th>Public Action</th>
<th>Requester STA Address</th>
<th>Responder STA Address</th>
<th>Reason Result Code</th>
<th>Enablement Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

**Figure 8-446—DSE Enablement frame Action field format**

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Enablement frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that grants enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-213.

### Table 8-213—Reason Result Code field values

<table>
<thead>
<tr>
<th>Reason Result Code field value</th>
<th>Name</th>

</tr>
</tbody>
</table>
The Enablement Identifier field is a 16-bit number assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 10.12.

### 8.5.8.5 DSE Deenablement frame format

The DSE Deenablement frame is an Action frame. It is transmitted by a STA as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 8-447.

<table>
<thead>
<tr>
<th>Category</th>
<th>Public Action</th>
<th>Requester STA Address</th>
<th>Responder STA Address</th>
<th>Reason Result Code</th>

</tr>
</tbody>
</table>

**Figure 8-447—DSE Deenablement frame Action field format**

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Deenablement frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-214.

**Table 8-213—Reason Result Code field values (continued)**

</tbody>
</table>

Figure 8-448—DSE Registered Location Announcement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Registered Location Announcement frame, as defined in Table 8-210.

The remaining fields are as defined in the DSE Registered Location element body (see 8.4.2.54).

8.5.8.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP in an infrastructure BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 8-449.

<table>
<thead>
<tr>
<th>Category</th>

</tbody>
</table>

Figure 8-449—Extended Channel Switch Announcement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate an Extended Channel Switch Announcement frame, as defined in Table 8-210.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 8.4.2.55).

Mesh Channel Switch Parameters element is defined in 8.4.2.105. This element is present when a mesh STA performs MBSS channel switch. The Mesh Channel Switch Parameters element is not included for channel switch other than the MBSS channel switch.

8.5.8.8 DSE Measurement Request frame format

The DSE Measurement Request frame is a Public Action frame requesting a DSE measurement report. It is transmitted by a STA using the procedures defined in 10.12. The format of the DSE Measurement Request frame Action field is shown in Figure 8-450.
The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Measurement Request frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

### 8.5.8.9 DSE Measurement Report frame format

The DSE Measurement Report frame is a Public Action frame. It is transmitted by a STA using the procedures defined in 10.12. The format of the DSE Measurement Report frame Action field is shown in Figure 8-451.

<table>
<thead>
<tr>
<th>Category</th>
<th>Public Action</th>
<th>Requester STA Address</th>
<th>Responder STA Address</th>
<th>Length</th>
<th>Operating Class</th>
<th>Channel Number</th>
<th>Measurement Report Mode</th>
<th>Actual Measurement Start Time</th>
<th>Measurement Duration</th>
<th>Reported DSE LCI fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>6</td>
<td>1</td>
<td>1</td>
<td>8</td>
<td>2</td>
<td>n x 26</td>
<td></td>
</tr>
</tbody>
</table>

**Figure 8-451—DSE Measurement Report frame Action field format**

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Measurement Report frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.
The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is as defined in 8.4.2.24 (see Figure 8-141).

The Actual Measurement Start Time field is set to the measuring STA’s TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 8-452.

![Figure 8-452—DSE LCI field format](image)

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location element body (see 8.4.2.54).
8.5.8.10 DSE Power Constraint frame format

The DSE Power Constraint frame is a Public Action frame requesting that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 8-453.

<table>
<thead>
<tr>
<th>Category</th>
<th>Public Action</th>
<th>Requester STA Address</th>
<th>Responder STA Address</th>
<th>Reason Result Code</th>
<th>Local Power Constraint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Octets:</td>
<td>1</td>
<td>1</td>
<td>6</td>
<td>6</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 8-453—DSE Power Constraint frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Power Constraint frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants the enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-215.

Table 8-215—Reason Result Code field values

<table>
<thead>
<tr>
<th>Reason Result Code field value</th>

<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.
8.5.8.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 8-454.

The Category field is set to the value indicating the Public category, as specified in Table 8-38 in 8.4.1.11.

The Public Action field is set to the value indicating Vendor Specific Public, as specified in Table 8-210 in 8.5.8.1.

The Organization Identifier field contains a public organizationally unique identifier assigned by the IEEE and is specified in 8.4.1.31. The order of the Organization Identifier field is described in 8.2.2. The length of the Organization Identifier field is variable, as specified in 8.4.1.31.

The Vendor Specific Content contains the vendor-specific fields and may include elements defined in the standard. The length of the Vendor Specific Content in a Vendor Specific Public Action frame is limited by the maximum allowed MMPDU size.

8.5.8.12 GAS Initial Request frame format

The GAS Initial Request frame is a Public Action frame. It is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame body is shown in Table 8-216.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Category</td>
</tr>
<tr>

<tr>
<td>3</td>
<td>Advertisement Protocol element</td>
</tr>
<tr>
<td>4</td>
<td>Query Request length</td>
</tr>
<tr>
<td>5</td>
<td>Query Request</td>
</tr>
</tbody>
</table>

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Initial Request frame.

The Dialog Token field is defined in 8.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.
The Query Request length field is defined in Figure 8-455. The value of the Query Request length field is set to the total number of octets in the Query Request field.

\[
\begin{array}{c}
\text{B0} \\
\text{B15}
\end{array}
\]

\[
\text{Octets:} \quad 2
\]

**Figure 8-455—Query Request length field**

The Query Request field is defined in Figure 8-456. The Query Request field is a generic container whose value is a GAS Query that is formatted in accordance with the protocol specified in the Advertisement Protocol element.

\[
\begin{array}{c}
\text{Octets:} \quad \text{variable}
\end{array}
\]

**Figure 8-456—Query Request field**

### 8.5.8.13 GAS Initial Response frame format

The GAS Initial Response frame is a Public Action frame. It is transmitted by a STA responding to a GAS Initial Request frame. The format of the GAS Initial Response frame body is shown in Table 8-217.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Category</td>
</tr>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>

<td>Dialog Token</td>
</tr>
<tr>
<td>3</td>
<td>Status Code</td>
</tr>
<tr>
<td>4</td>
<td>GAS Comeback Delay</td>
</tr>
<tr>
<td>5</td>
<td>Advertisement Protocol element</td>
</tr>
<tr>
<td>6</td>
<td>Query Response Length</td>
</tr>
<tr>
<td>7</td>
<td>Query Response (optional)</td>
</tr>
</tbody>
</table>

**Table 8-217—GAS Initial Response frame body format**

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Initial Response frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

The Status Code values are defined in Table 8-37.
The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is provided in Figure 8-457. The behavior is described in 10.24.3.1. The value 0 will be returned by the STA when a Query Response is provided in this frame.

![Figure 8-457—GAS Comeback Delay field](image)

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 8-458. The value of the Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

![Figure 8-458—Query Response length field](image)

The Query Response field is defined in Figure 8-459. The Query Response field is a generic container whose value is the response to a GAS Query and is formatted in accordance with the protocol specified in the Advertisement Protocol element.

![Figure 8-459—Query Response field](image)

8.5.8.14 GAS Comeback Request frame format

The GAS Comeback Request frame is a Public Action frame. It is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame body is shown in Table 8-218.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Category</td>
</tr>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>
<td>2</td>
<td>Dialog Token</td>
</tr>
</tbody>
</table>

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.
The Action field is set to the value specified in Table 8-210 for a GAS Comeback Request frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

### 8.5.8.15 GAS Comeback Response frame format

The GAS Comeback Response frame is a Public Action frame. It is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame body is shown in Table 8-219.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Category</td>
</tr>
<tr>
<td>1</td>
<td>Action</td>
</tr>
<tr>
<td>2</td>
<td>Dialog Token</td>
</tr>
<tr>
<td>3</td>
<td>Status Code</td>
</tr>
<tr>
<td>4</td>
<td>GAS Query Response Fragment ID</td>
</tr>
<tr>
<td>5</td>
<td>GAS Comeback Delay</td>
</tr>
<tr>
<td>6</td>
<td>Advertisement Protocol element</td>
</tr>
<tr>
<td>7</td>
<td>Query Response Length</td>
</tr>
<tr>
<td>8</td>
<td>Query Response (optional)</td>
</tr>
</tbody>
</table>

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Comeback Response frame.

The Dialog Token field is copied from the Dialog Token field of the corresponding GAS Comeback Request frame. The same dialog token value will be present in all fragments of a multi-fragment query response.

The Status Code values are defined in Table 8-37. The same status code value will be present in all fragments of a multi-fragment query response.

The GAS Query Response Fragment ID is defined in 8.4.1.33. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Response Fragment ID to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Response Fragment ID to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment Query Response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Response Fragment ID field having a nonzero Fragment ID and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is provided in Figure 8-457. A nonzero GAS Comeback Delay value is returned by the responding STA in this frame to indicate that the GAS Query being carried out on behalf of the requesting STA is still in progress.
— A nonzero value indicates to the requesting STA that another GAS Comeback frame exchange should be performed after expiry of the GAS Comeback Delay timer in order to retrieve the query response.

— This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 8-458. The value of the Query Response Length field is the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 8-459. The value of the Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment query response, the response to the query posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

### 8.5.8.16 TDLS Discovery Response frame format

The TDLS Discovery Response frame contains the information shown in Table 8-220.

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Category</td>
<td>The Category field is set to the value for Public, as defined in Table 8-38.</td>
</tr>
<tr>
<td>2</td>
<td>Action</td>
<td>The Action field is set to 14, representing TDLS Discovery Response.</td>
</tr>
<tr>
<td>3</td>
<td>Dialog Token</td>
<td>The Dialog Token is copied from the corresponding TDLS Discovery Request frame. The Dialog Token is specified in 8.4.1.12.</td>
</tr>
<tr>
<td>4</td>
<td>Capability</td>
<td>The Capability field indicates the capabilities of the STA. The Capability field is defined in 8.4.1.4.</td>
</tr>
<tr>
<td>5</td>
<td>Supported rates</td>
<td>The Supported Rates element indicates the rates which are supported by the STA. The Supported Rates element is defined in 8.4.2.3.</td>
</tr>
<tr>
<td>6</td>
<td>Extended supported rates</td>
<td>The Extended Supported Rates element is present whenever there are more than eight supported rates, and it is optional otherwise. The Extended Supported Rates element is defined in 8.4.2.15.</td>
</tr>
<tr>
<td>7</td>
<td>Supported Channels</td>
<td>The Supported Channels element is present if the TDLS channel switching capability field is equal to 1. The Supported Channels element is defined in 8.4.2.20.</td>
</tr>
<tr>
<td>8</td>
<td>RSNE</td>
<td>The RSNE is optionally present if security is required on the direct link. The RSNE is defined in 8.4.2.27.</td>
</tr>
<tr>
<td>9</td>
<td>Extended Capabilities</td>
<td>The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 8.4.2.29.</td>
</tr>
<tr>
<td>10</td>
<td>FTE</td>
<td>The FTE is optionally present if security is required on the direct link. The FTE is defined in 8.4.2.50.</td>
</tr>
</tbody>
</table>
The TDLS Discovery Response frame is transmitted directly (i.e., not via the AP) to the TDLS peer STA that sent the corresponding TDLS Discovery Request frame. See 10.22.

### 8.5.8.17 Location Track Notification frame format

The Location Track Notification frame uses the Action frame body format and is transmitted by a STA to allow remote location determination to occur by another STA. The format of the Location Track Notification frame body is shown in Figure 8-460.

**Table 8-220—Information for TDLS Discovery Response frame (continued)**

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Timeout Interval (TPK Key Lifetime)</td>
<td>The Timeout Interval element contains the TPK Key Lifetime. It is present if security is required on the direct link. The Timeout Interval element is defined in 8.4.2.51.</td>
</tr>
<tr>
<td>12</td>
<td>Supported Operating Classes</td>
<td>The Supported Operating Classes element is present if the TDLS channel switching capability field is equal to 1. The Supported Operating Classes element is defined in 8.4.2.56.</td>
</tr>
<tr>
<td>13</td>
<td>HT Capabilities</td>
<td>The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. The HT Capabilities element is defined in 8.4.2.58.</td>
</tr>
<tr>
<td>14</td>
<td>20/40 BSS Coexistence</td>
<td>The 20/40 BSS Coexistence element is present when dot12040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 8.4.2.60.</td>
</tr>
<tr>
<td>15</td>
<td>Link Identifier</td>
<td>The Link Identifier element is defined in 8.4.2.64.</td>
</tr>
</tbody>
</table>

The TDLS Discovery Response frame is transmitted directly (i.e., not via the AP) to the TDLS peer STA that sent the corresponding TDLS Discovery Request frame. See 10.22.

**Figure 8-460—Location Track Notification frame format**

The Category field is the value for Public Action defined Table 8-38.

The Action field is the value indicating Location Track Notification, as specified in Table 8-210.

The Location Parameters Element field contains the Location Parameters subelements, described in Table 8-153. Table 8-221 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

**Table 8-221—Location Parameters Element field for Location Track Notification frame**

<table>
<thead>
<tr>
<th>Allowed subelements</th>
<th>Subelement ID</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location Indication Channels</td>
<td>2</td>
<td>The Location Indication Channels subelement is included in the Location Track Notification frame.</td>
</tr>
<tr>
<td>Radio Information</td>
<td>4</td>
<td>The Radio Information subelement is included in the Location Track Notification frame.</td>
</tr>
</tbody>
</table>
The Measurement Report Element field contains a Measurement Report element of type Beacon Report as defined in 8.4.2.24.7. The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the Dialog Token in the Location Configuration Request frame that configured the STA.

### 8.5.9 FT Action frame details

#### 8.5.9.1 General

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 8-222.

<table>
<thead>
<tr>
<th>FT Action field value</th>

<td>FT Ack frames</td>
</tr>
<tr>
<td>5–255</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

#### 8.5.9.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.
Figure 8-461 shows the format of the FT Request frame Action field.

\[
\begin{array}{|c|c|c|c|}
\hline
\text{Category} & \text{FT Action} & \text{STA Address} & \text{Target AP Address} \\
\hline
1 & 1 & 6 & 6 \\
\hline
\text{FT Request frame body} & \text{variable} \\
\hline
\end{array}
\]

**Figure 8-461—FT Request frame Action field format**

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Request frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Request frame body contains the information shown in Table 8-223.

**Table 8-223—FT Request frame body**

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RSN</td>
<td>A RSNE is present if dot11RSNAActivated is true.</td>
</tr>
<tr>
<td>2</td>

<td>The MDE is present.</td>
</tr>
<tr>
<td>3</td>
<td>Fast BSS Transition</td>
<td>An FTE is present if dot11RSNAActivated is true.</td>
</tr>
</tbody>
</table>

The usage of these elements is defined in 12.8.2.

**8.5.9.3 FT Response frame**

The FT Response frame is transmitted by the currently associated AP as a response to the STA’s FT Request frame. Figure 8-462 shows the format of the FT Response frame Action field.

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{Category} & \text{FT Action} & \text{STA Address} & \text{Target AP Address} & \text{Status Code} \\
\hline
1 & 1 & 6 & 6 & 2 \\
\hline
\text{FT Response frame body} & \text{variable} \\
\hline
\end{array}
\]

**Figure 8-462—FT Response frame Action field format**

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Response frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 8.4.1.9.
If the Status Code field is 0, then the FT Response frame body contains the information shown in Table 8-224.

Table 8-224—FT Response frame body

<table>
<thead>
<tr>
<th>Order</th>
<th>Information</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RSN</td>
<td>The RSNE is present if dot11RSNAActivated is true.</td>
</tr>

<td>The MDE is present.</td>
</tr>
<tr>
<td>3</td>
<td>Fast BSS Transition</td>
<td>An FTE is present if dot11RSNAActivated is true.</td>
</tr>
</tbody>
</table>

The usage of these elements is defined in 12.8.3.

8.5.9.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 8-463 shows the FT Confirm frame Action field format.

Figure 8-463—FT Confirm frame Action field format

<table>

</tr>
</tbody>
</table>

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Confirm frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Confirm frame body contains the information shown in Table 8-225.

Table 8-225—FT Confirm frame body
